SPECIAL NOTES

API publications necessarily address problems of a general nature. With respect to particular circumstances, local, state, and federal laws and regulations should be reviewed.

API is not undertaking to meet the duties of employers, manufacturers, or suppliers to warn and properly train and equip their employees, and others exposed, concerning health and safety risks and precautions, nor undertaking their obligations under local, state, or federal laws.

Information concerning safety and health risks and proper precautions with respect to particular materials and conditions should be obtained from the employer, the manufacturer or supplier of that material, or the material safety data sheet.

Nothing contained in any API publication is to be construed as granting any right, by implication or otherwise, for the manufacture, sale, or use of any method, apparatus, or product covered by letters patent. Neither should anything contained in the publication be construed as insuring anyone against liability for infringement of letters patent.

Generally, API standards are reviewed and revised, reaffirmed, or withdrawn at least every five years. Sometimes a one-time extension of up to two years will be added to this review cycle. This publication will no longer be in effect five years after its publication date as an operative API standard or, where an extension has been granted, upon republication. Status of the publication can be ascertained from the API Upstream Segment [telephone (202) 682-8000]. A catalog of API publications and materials is published annually and updated quarterly by API, 1220 L Street, N.W., Washington, D.C. 20005.

This document was produced under API standardization procedures that ensure appropriate notification and participation in the developmental process and is designated as an API standard. Questions concerning the interpretation of the content of this standard or comments and questions concerning the procedures under which this standard was developed should be directed in writing to the general manager of the Upstream Segment, American Petroleum Institute, 1220 L Street, N.W., Washington, D.C. 20005. Requests for permission to reproduce or translate all or any part of the material published herein should also be addressed to the general manager.

API standards are published to facilitate the broad availability of proven, sound engineering and operating practices. These standards are not intended to obviate the need for applying sound engineering judgment regarding when and where these standards should be utilized. The formulation and publication of API standards is not intended in any way to inhibit anyone from using any other practices.

Any manufacturer marking equipment or materials in conformance with the marking requirements of an API standard is solely responsible for complying with all the applicable requirements of that standard. API does not represent, warrant, or guarantee that such products do in fact conform to the applicable API standard.

FOREWORD

Specification 5L covers seamless and welded steel line pipe. It includes plain-end, threaded-end, and belled-end pipe, as well as through-the-flowline (TFL) pipe and pipe with ends prepared for use with special couplings.

Although the plain-end line pipe meeting this specification is primarily intended for field makeup by circumferential welding, the manufacturer will not assume responsibility for field welding.

The purpose of this specification is to provide standards for pipe suitable for use in conveying gas, water, and oil in both the oil and natural gas industries.

This specification is under the jurisdiction of the Committee on Standardization of Tubular Goods and includes changes to the previous edition approved by letter ballot through June 1999. Specifications 5LS and 5LX have been incorporated into this edition of Specification 5L. The last editions of Specifications 5LS and 5LX, published in March 1982, have been withdrawn.

Due to the large numbers of changes from the Forty-first Edition, change bars are not included in this edition.

This standard shall become effective on the date printed on the cover but may be used voluntarily from the date of distribution.

API publications may be used by anyone desiring to do so. Every effort has been made by the Institute to assure the accuracy and reliability of the data contained in them; however, the Institute makes no representation, warranty, or guarantee in connection with this publication and hereby expressly disclaims any liability or responsibility for loss or damage resulting from its use or for the violation of any federal, state, or municipal regulation with which this publication may conflict.

Suggested revisions are invited and should be submitted to the general manager of the Upstream Segment, American Petroleum Institute, 1220 L Street, N.W., Washington, D.C. 20005.

Specification for Line Pipe

1 Scope

1.1 PURPOSE AND COVERAGE

The purpose of this specification is to provide standards for pipe suitable for use in conveying gas, water, and oil in both the oil and natural gas industries.

This specification covers seamless and welded steel line pipe. It includes plain-end, threaded-end, and belled-end pipe, as well as through-the-flowline (TFL) pipe and pipe with ends prepared for use with special couplings.

Although the plain-end line pipe meeting this specification is primarily intended for field makeup by circumferential welding, the manufacturer will not assume responsibility for field welding.

1.2 PRODUCT SPECIFICATION LEVEL (PSL)

This specification establishes requirements for two product specification levels (PSL 1 and PSL 2). These two PSL designations define different levels of standard technical requirements. PSL 2 has mandatory requirements for carbon equivalent, notch toughness, maximum yield strength, and maximum tensile strength. These and other differences are summarized in Appendix J.

Requirements that apply to only PSL 1 or only PSL 2 are so designated. Requirements that are not designated to a specific PSL apply to both PSL 1 and PSL 2.

The purchaser may add requirements to purchase orders for either PSL 1 or PSL 2, as provided by the supplementary requirements (Appendix F) and other options (4.2 and 4.3).

1.3 GRADES

The grades (see the note) covered by this specification are the standard Grades A25, A, B, X42, X46, X52, X56, X60, X65, X70 and X80; and any intermediate grades (grades that are higher than X42, intermediate to two sequential standard grades, and agreed upon by the purchaser and manufacturer).

PSL 1 pipe can be supplied in Grades A25 through X70.

PSL 2 pipe can be supplied in Grades B through X80.

Class II (CI II) steel is rephosphorized and probably has better threading properties than Class I (CI I). Because Class II (CI II) has higher phosphorus content than Class I (CI I), it may be somewhat more difficult to bend.

Pipe manufactured as Grade X60 or higher shall not be substituted for pipe ordered as Grade X52 or lower without purchaser approval.

Note: The grade designations are dimensionless. Grades A and B do not include reference to the specified minimum yield strength; however, other grade designations are composed of the letter A or X,

followed by the first two digits of the specified minimum yield strength in U.S. Customary units.

1.4 DIMENSIONS

The sizes used herein are dimensionless designations, which are derived from the specified outside diameter as measured in U.S. Customary units, and provide a convenient method of referencing pipe size within the text and tables (but not for order descriptions). Pipe sizes $2\frac{3}{8}$ and larger are expressed as integers and fractions; pipe sizes smaller than $2\frac{3}{8}$ are expressed to three decimal places. These sizes replace the “size designation” and the “nominal size designation” used in the previous edition of this specification. Users of this specification who are accustomed to specifying nominal sizes rather than OD sizes are advised to familiarize themselves with these new size designations used in this specification, especially the usage in Tables 4, 5, and 6A.

PSL 1 pipe can be supplied in sizes ranging from 0.405 through 80.

PSL 2 pipe can be supplied in sizes ranging from $4\frac{1}{2}$ through 80.

Dimensional requirements on threads and thread gages, stipulations on gaging practice, gage specifications and certification, as well as instruments and methods for inspection of threads are given in API Standard 5B and are applicable to threaded products covered by this specification.

1.5 UNITS

U.S. Customary units are used in this specification; SI (metric) units are shown in parentheses in the text and in many tables. The values stated in either U.S. Customary units or SI units are to be regarded separately as standard. The values stated are not necessarily exact equivalents; therefore, each system is to be used independently of the other, without combining values for any specific order item.

See Appendix M for specific information about rounding procedures and conversion factors.

2.2 Requirements of standards included by reference in this specification are essential to the safety and interchangeability of the equipment produced.

2.3 Standards referenced in this specification may be replaced by other international or national standards that can be shown to meet the requirements of the referenced standard. Manufacturers who use other standards in lieu of stan-

dards referenced herein are responsible for documenting the equivalency of the standards.

3 Definitions

For the purposes of this specification, the following definitions apply:

3.1 carload: The quantity of pipe loaded on a rail car for shipment from the pipe-making facilities.

3.2 defect: An imperfection of sufficient magnitude to warrant rejection of the product based on the stipulations of this specification.

3.3 heat: The metal produced by a single cycle of a batch melting process.

3.4 heat analysis: The chemical analysis representative of a heat as reported by the metal producer.

3.5 imperfection: A discontinuity or irregularity in the product detected by methods outlined in this specification.

3.6 inspection lot: A definite quantity of product manufactured under conditions that are considered uniform for the attribute to be inspected.

3.7 manufacturer: A firm, company, or corporation responsible for marking the product to warrant that it conforms to this specification. The manufacturer may be, as applicable, a pipe mill or processor; a maker of couplings; or a threader. The manufacturer is responsible for compliance with all of the applicable provisions of this specification.

3.8 may: Used as a verb to indicate that a provision is optional.

3.9 pipe mill: A firm, company, or corporation that operates pipe-making facilities.

3.10 processor: A firm, company, or corporation that operates facilities capable of heat treating pipe made by a pipe mill.

3.11 product analysis: A chemical analysis of the pipe, plate, or skelp.

3.12 PSL: Abbreviation for product specification level.

3.13 shall: Used to indicate that a provision is mandatory.

3.14 should: Used to indicate that a provision is not mandatory but is recommended as good practice.

¹American Association of Railroads, Operations and Maintenance Department, Mechanical Division, 50 F Street Northwest, Washington DC 20001.

²ASME International, 3 Park Avenue, New York, New York 10016-5990.

³American Society for Testing and Materials, 100 Barr Harbor Drive, West Conshohocken, Pennsylvania 19428-2959.

3.15 special processes: Final operations performed during pipe manufacturing that affect attribute compliance required in this specification (except chemistry and dimensions). The applicable special processes are as follows:

Manufacturing Condition	Special Processes
a. Seamless:	
1. As-rolled (nonexpanded)	Final reheating and hot sizing or stretch reduction. Cold finishing, if applied, and repair welding. Non-destructive inspection.
2. As-rolled (expanded)	Expansion, nondestructive inspection, and repair welding.
3. Heat treated	Heat treatment, nondestructive inspection, and repair welding.
b. Welded without filler metal:	
1. As-rolled (nonexpanded)	Seam welding, nondestructive inspection and sizing. If applicable, seam heat treatment and repair welding.
2. As-rolled (expanded)	Seam welding, expansion, and nondestructive inspection. If applicable, seam heat treatment, and repair welding.
3. Heat treated	Seam welding, full body heat treatment, and nondestructive inspection. If applicable, repair welding.
c. Welded with filler metal:	
1. As-rolled (nonexpanded)	Pipe forming, seam welding, nondestructive inspection, and repair welding.
2. As-rolled (expanded)	Seam welding, expansion, nondestructive inspection, and repair welding.
3. Heat treated	Seam welding, nondestructive inspection, repair welding, and full body heat treatment.
4. As-rolled	Seam welding, sizing, and nondestructive inspection.

4 Information to be Supplied by the Purchaser (See Note 1)

4.1 In placing orders for line pipe to be manufactured in accordance with API Spec 5L, the purchaser should specify the following on the purchase order:

Information	Reference
Specification	API Spec 5L
PSL (Product Specification Level)	Paragraph 1.2 and Table 1
Quantity	
Grade (and class, if applicable)	Tables 2 and 3
Type of pipe	Paragraph 5.1.3
Size or outside diameter	Paragraph 7.1
Wall thickness	Paragraph 7.1
Nominal length	Paragraph 7.5 and Table 11
End finish	Paragraph 7.9
Delivery date and shipping instructions	

4.2 The purchaser should also state on the purchase order his requirements concerning the following stipulations, which are optional with the purchaser:

Information	Reference
Certificate of compliance, general	Paragraph 12.1
Certificate of compliance, with test results	Paragraph 12.1 and SR 15
Cold expanded or nonexpanded pipe	Paragraph 5.2
High carbon equivalent pipe	Paragraph 6.1.3.2
Optional fracture toughness: test type, temperature, and Charpy energy value	Paragraph 6.2.6; SR5; SR6; SR19
Acceptance and maximum percent of jointers	Paragraph 7.7
Jointers for threaded pipe	Paragraph 7.7
Thread compound	Paragraph 7.9.2
Reduced negative tolerance for wall thickness	Tables 9 and 10
Power-tight makeup	Paragraph 7.9.2
Specific edition of Spec 5L for pipe and couplings	Paragraph 7.9.2
Alternative bevel or end preparation, plain-end pipe	Paragraph 7.9.3

Information	Reference
Alternative minimum hydrostatic test pressure	Paragraph 9.4.3
Hydrostatic test pressure, maximum	Paragraph 9.4.3
Special inspection of electric welded seams	Paragraph 9.7.2.2 and SR17
Alternative inspection of laser welded seams	Paragraph 9.7.2.3 and SR17
Nondestructive testing of seamless pipe	Paragraph 9.7.2.6 and SR4
Type of penetrometer for radiological inspection	Paragraph 9.7.3.4
Bare pipe; temporary and special coatings	Paragraph 11.1
Special nondestructive inspection for laminations	Paragraph 7.8.10
Demonstration of capability of magnetic particle inspection method	Paragraph 9.7.5.2
Through-the-Flowline (TFL) Pipe	SR7
Length tolerance and jointer allowance for TFL pipe	Paragraph SR7.2
Marking Requirements	
Alternative length units	Paragraphs 10.5 and I.5
Additional markings for compatible standards	Paragraphs 10.1.3 and I.1.3
Marking location and sequence for welded pipe, size 16 and larger	Paragraphs 10.2c and I.2.3
Die stamping of pipe or plate	Paragraphs 10.7 and I.7
Method of welding jointers	Paragraph A.1
Purchaser inspection	Paragraph 9.7.1 and Appendix H
Inspection location	Paragraph H.2
Monogram marking (see Note 2)	Paragraph I.1

4.3 The following stipulations are subject to agreement between the purchaser and the manufacturer:

Information	Reference
Alternative heat treatment for electric weld seams	Paragraph 5.1.3.3
Alternative heat treatment for laser weld seams	Paragraph 5.1.3.4
Quenching and tempering of Grade B pipe	Paragraph 5.4
Skelp end welds at pipe ends	Paragraph 5.5
Chemical composition	Paragraph 6.1.1
Intermediate grade	Paragraphs 6.1.1 and 6.2.1
Carbon equivalent limit (PSL 2)	
Grade X80	Paragraph 6.1.3.2
Seamless with wall thickness > 0.800 in (20.3 mm)	Paragraph 6.1.3.2
High carbon equivalent pipe	Paragraph 6.1.3.2
Charpy specimen size for optional fracture toughness	Paragraph SR5.3
Type of notch for drop weight tear test specimens	SR6.3
Internal diameter tolerance	Paragraph 7.2
Intermediate diameter	Paragraph 7.1
Intermediate wall thickness	Paragraph 7.1
Skelp end welds at jointer welds	Paragraph 7.7
Hydrostatic test for threaded and coupled pipe	Paragraph 9.4.1
Higher hydrostatic test pressure	Paragraph 9.4.3
End load compensation for hydrotest producing stress > 90% SMYS	Paragraph 9.4.3 and Appendix K
Supplementary hydrostatic test	Paragraph 9.4.4
Diameter tolerance for nonstandard hydrotest	Table 7
Alternative nondestructive test method for seams at ends of electric welded pipe	Paragraph 9.7.2.2
Alternative nondestructive test method for seams at ends of laser welded pipe	Paragraph 9.7.2.3
Alternative penetrometer for radiological inspection	Paragraph 9.7.3.4
Alternative reinspection method for gas-metal-arc welds	Paragraph 9.7.4.3
Alternative reference standard for nondestructive inspection of seamless	Paragraph SR4.3.2
Technique for nondestructive inspection of electric welds and laser welds	Paragraph SR17.2
Length tolerances applied to carloads	Table 11
Nonstandard length and length tolerances	Paragraph 7.5
Welded couplings	Paragraph 8.1

Information	Reference
NDT for repair of pipe body by welding	Paragraph B.1.1
Repair of weld seams of electric welded pipe	Paragraphs 9.7.4.4 and B.1.2
Repair of weld seams of laser welded pipe	Paragraphs 9.7.4.4 and B.1.2
Repair of heat-treated pipe by welding	Paragraph B.1.3
Reprocessing by heat-treatment	Paragraphs 9.11 and SR5.4
Disposition of product rejected by purchaser	Paragraph H.4
Marking requirements	
Marking of couplings without die stamping	Paragraphs 10.1.2 and I.1.2
Marking on interior instead of exterior (welded pipe < size 16, and seamless pipe)	Paragraphs 10.2b and I.2.2
Color code marking for grade	Paragraphs 10.3.5 and I.3.5; SR3
Nonstandard units of length	Paragraphs 10.5 and I.5
Location for length markings	Paragraphs 10.5a and I.5a
Use of cold die stamping	Paragraphs 10.7 and I.7

Notes:

1. Nothing in this specification should be interpreted as indicating a preference by the committee for any material or process or as indicating equality between the various materials or processes. In the selection of materials and processes, the purchaser has to be guided by experience and by the service for which the pipe is intended.
2. Users of this specification should note that there is no longer a requirement for marking a product with the API monogram. The American Petroleum Institute continues to license use of the monogram on products covered by this specification, but it is administered by the staff of the Institute separately from the specification. The policy describing use of the monogram is contained in Appendix I. No other use of the monogram is permitted. Licensees mark products in accordance with Appendix I or Section 10, and nonlicensees mark products in accordance with Section 10.

5 Process of Manufacture and Material

5.1 PROCESS OF MANUFACTURE

Pipe furnished to this specification shall be either seamless or welded as defined in 5.1.1, 5.1.2, and 5.1.3 and shall be limited to the product specification levels, grades, types of pipe, and size limitations specified in Table 1.

5.1.1 Seamless Process

The seamless process is a process of hot working steel to form a tubular product without a welded seam. If necessary, the hot worked tubular product may be subsequently cold finished to produce the desired shape, dimensions, and properties.

5.1.2 Welding Processes

5.1.2.1 Without Filler Metal

5.1.2.1.1 Continuous Welding

Continuous welding is a process of forming a seam by heating the skelp in a furnace and mechanically pressing the formed edges together wherein successive coils of skelp have been joined together to provide a continuous flow of steel for the welding mill. (This process is a type of butt-welding.)

5.1.2.1.2 Electric Welding

Electric welding is a process of forming a seam by electric-resistance or electric-induction welding wherein the edges to be welded are mechanically pressed together and the

heat for welding is generated by the resistance to flow of the electric current.

5.1.2.1.3 Laser Welding

Laser welding is a welding process that uses a laser beam and a keyholing technique to produce melting and coalescence of the edges to be welded. The edges may be preheated. Shielding is obtained entirely from an externally supplied gas or gas mixture.

5.1.2.2 With Filler Metal

5.1.2.2.1 Submerged-Arc Welding

Submerged-arc welding is a welding process that produces coalescence of metals by heating them with an arc or arcs between a bare metal consumable electrode or electrodes and the work. The arc and molten metal are shielded by a blanket of granular, fusible material on the work. Pressure is not used, and part or all of the filler metal is obtained from the electrodes.

5.1.2.2.2 Gas Metal-Arc Welding

Gas metal-arc welding is a welding process that produces coalescence of metals by heating them with an arc or arcs between a continuous consumable electrode and the work. Shielding is obtained entirely from an externally supplied gas or gas mixture. Pressure is not used, and the filler metal is obtained from the electrode.

5.1.3 Types of Pipe

5.1.3.1 Seamless Pipe

Seamless pipe is produced by the seamless process defined in 5.1.1.

5.1.3.2 Continuous Welded Pipe

Continuous welded pipe is defined as pipe that has one longitudinal seam produced by the continuous welding process defined in 5.1.2.1.1. (This is a type of butt-welded pipe.)

5.1.3.3 Electric Welded Pipe

Electric welded pipe is defined as pipe that has one longitudinal seam produced by the electric welding process defined in 5.1.2.1.2.

5.1.3.3.1 PSL 1 Electric Welded Pipe

For grades higher than X42, the weld seam and the entire heat affected zone shall be heat treated so as to simulate a normalizing heat treatment (see note), except that by agreement between the purchaser and the manufacturer alternative heat treatments or combinations of heat treatment and chemical composition may be substituted. Where such substitutions are made, the manufacturer shall demonstrate the effectiveness of the method selected using a procedure that is mutually agreed upon. This procedure may include, but is not necessarily limited to, hardness testing, microstructural evaluation, or mechanical testing. For grades X42 and lower, the weld seam shall be similarly heat treated, or the pipe shall be processed in such a manner that no untempered martensite remains.

Note: During the manufacture of electric welded pipe, the product is in motion through the surrounding air. Normalizing is usually defined with "cooling in still air;" hence the phrase "to simulate a normalizing heat treatment" is used here.

5.1.3.3.2 PSL 2 Electric Welded Pipe

Electric welding shall be performed with a minimum welder frequency of 100 kHz.

For all grades, the weld seam and the entire heat affected zone shall be heat treated so as to simulate a normalizing heat treatment (see note in 5.1.3.3.1), except that by agreement between the purchaser and the manufacturer alternative heat treatments or combinations of heat treatment and chemical composition may be substituted. Where such substitutions are made, the manufacturer shall demonstrate the effectiveness of the method selected using a procedure that is mutually agreed upon. This procedure may include, but is not necessarily limited to, hardness testing, microstructural evaluation, or mechanical testing.

5.1.3.4 Laser Welded Pipe

Laser welded pipe is defined as pipe that has one longitudinal seam produced by the laser welding process defined in 5.1.2.1.3.

The weld seam and the entire heat affected zone of laser welded pipe shall be heat treated so as to simulate a normalizing heat treatment, except that by agreement between the purchaser and manufacturer, an alternative process may be substituted. Where such substitution is made, the manufacturer shall demonstrate the effectiveness of the method selected, using a procedure that is mutually agreed upon. This procedure may include, but is not necessarily limited to, hardness testing, microstructural evaluation, or mechanical testing.

Note: During the manufacture of laser welded pipe, the product is in motion through the surrounding air. Normalizing is usually defined with "cooling in still air;" hence the phrase "to simulate a normalizing heat treatment" is used here.

5.1.3.5 Longitudinal Seam Submerged-Arc Welded Pipe

Longitudinal seam submerged-arc welded pipe is defined as pipe that has one longitudinal seam produced by the automatic submerged-arc welding process defined in 5.1.2.2.1. At least one pass shall be on the inside and at least one pass shall be on the outside. (This type of pipe is also known as submerged-arc welded pipe.)

5.1.3.6 Gas Metal-Arc Welded Pipe

Gas metal-arc welded pipe is defined as pipe that has one longitudinal seam produced by the continuous gas metal-arc welding process defined in 5.1.2.2.2. At least one pass shall be on the inside and at least one pass shall be on the outside.

5.1.3.7 Combination Gas Metal-Arc and Submerged-Arc Welded Pipe

Combination gas metal-arc and submerged-arc welded pipe is defined as pipe that has one longitudinal seam produced by a combination of the welding processes defined in 5.1.2.2.1 and 5.1.2.2.2. The gas metal-arc welding process shall be continuous and first, and followed by the automatic submerged-arc welding process with at least one pass on the inside and at least one pass on the outside.

5.1.3.8 Double Seam Submerged-Arc Welded Pipe

Double seam submerged-arc welded pipe is defined as pipe that has two longitudinal seams produced by the automatic submerged-arc welding process defined in 5.1.2.2.1. The seams shall be approximately 180° apart. For each seam, at least one pass shall be on the inside and at least one pass shall be on the outside. All weld tests shall be performed after forming and welding.

5.1.3.9 Double Seam Gas Metal-Arc Welded Pipe

Double seam gas metal-arc welded pipe is defined as pipe that has two longitudinal seams produced by the gas metal-arc welding process defined in 5.1.2.2.2. The seams shall be approximately 180° apart. For each seam, at least one pass shall be on the inside and at least one pass shall be on the outside. All weld tests shall be performed after forming and welding.

5.1.3.10 Double Seam Combination Gas Metal-Arc and Submerged-Arc Welded Pipe

Double seam combination gas metal-arc and submerged-arc welded pipe is defined as pipe that has two longitudinal seams produced by a combination of the welding processes defined in 5.1.2.2.1 and 5.1.2.2.2. The seams shall be approximately 180° apart. For each seam, the gas metal-arc welding shall be continuous and first, and followed by the automatic submerged-arc welding process with at least one pass on the inside and at least one pass on the outside. All weld tests shall be performed after forming and welding.

5.1.3.11 Helical Seam Submerged-Arc Welded Pipe

Helical seam submerged-arc welded pipe is defined as pipe that has one helical seam produced by the automatic submerged-arc welding process defined in 5.1.2.2.1. At least one pass shall be on the inside and at least one pass shall be on the outside. (This type of pipe is also known as spiral weld pipe.)

5.1.4 Types of Seam Welds

5.1.4.1 Electric Weld

An electric weld is a longitudinal seam weld produced by the electric welding process defined in 5.1.2.1.2.

5.1.4.2 Laser Weld

A laser weld is a longitudinal seam weld produced by the laser welding process defined in 5.1.2.1.3.

5.1.4.3 Submerged-Arc Weld

A submerged-arc weld is a longitudinal or helical seam weld produced by the submerged-arc welding process defined in 5.1.2.2.1.

5.1.4.4 Gas Metal-Arc Weld

A gas metal-arc weld is a longitudinal seam weld produced in whole or in part by the continuous gas metal-arc welding process defined in 5.1.2.2.2.

5.1.4.5 Skelp End Weld

A skelp end weld is a seam weld that joins plate or skelp ends together in helical seam pipe.

5.1.4.6 Jointer Weld

A jointer weld is a circumferential seam weld that joins two pieces of pipe together.

5.1.4.7 Tack Weld

A tack weld is a seam weld used to align the abutting edges until the final seam welds are produced. Tack welds shall be made by the following: (a) manual or semi-automatic submerged-arc welding, (b) electric welding, (c) gas metal-arc welding, (d) flux cored arc welding, or (e) shielded metal-arc welding using low hydrogen electrodes. Tack welds shall be removed by machining or remelting during subsequent welding of the seam.

5.2 COLD EXPANSION

Pipe furnished to this specification, except continuous welded, shall be either nonexpanded or cold expanded at the option of the manufacturer, unless otherwise specified on the purchase order. Suitable provision shall be incorporated to protect the weld from contact with the internal expander during mechanical expansion.

5.3 MATERIAL

5.3.1 Plate and Skelp for Helical Seam Pipe

The width of plate or skelp used to manufacture helical seam pipe shall not be less than 0.8 or more than 3.0 times the outside diameter of the pipe.

5.3.2 Repairs by Welding of Plate or Skelp (PSL 2 Only)

The plate or skelp used for PSL 2 pipe shall not contain any repair welds.

5.4 HEAT TREATMENT

The heat treating process shall be performed in accordance with a documented procedure. Pipe furnished to this specification may be as-rolled, normalized, normalized and tempered, subcritically stress relieved, or subcritically age hardened; and X Grades may be quenched and tempered. Grade B pipe that is quenched and tempered shall be seamless, meet the requirements of Supplementary Requirement 4 (SR4 of Appendix F), and be by agreement between purchaser and manufacturer. See Section 10 for applicable marking requirements.

5.5 SKELP END WELDS IN HELICAL SEAM PIPE

Junctions of skelp end welds and helical seam welds in finished pipe shall be permitted only at distances greater than 12 in. (305 mm) from the pipe ends. By agreement between the purchaser and the manufacturer, skelp end welds shall be permitted at the pipe ends, provided there is a circumferential

separation of at least 6 in. (152 mm) between the skelp end weld and the helical seam weld at the applicable pipe ends. Skelp end welds in finished pipe shall be properly prepared for welding and shall be made by automatic submerged-arc welding, automatic gas metal-arc welding, or a combination of both processes.

5.6 TRACEABILITY

5.6.1 PSL 1 Traceability Requirements

The manufacturer shall establish and follow procedures for maintaining heat and/or lot identity until all required heat and/or lot tests are performed and conformance with specification requirements is shown.

5.6.2 PSL 2 Traceability Requirements

The manufacturer shall comply with SR 15.2.

6 Material Requirements

6.1 CHEMICAL PROPERTIES

6.1.1 Chemical Composition

The composition of steel used for the manufacture of pipe furnished to this specification shall conform to the chemical requirements given in Table 2A (for PSL 1) or Table 2B (for PSL 2). The composition of intermediate grades (higher than X42) shall conform to the chemical requirements of the next higher standard grade. For Grades X42 and higher, by agreement between the purchaser and the manufacturer, elements other than those listed in Tables 2A and 2B (which include columbium [niobium], vanadium, and titanium via the notes to the tables) may be used; however, care should be exercised in determining the alloying content for any given size and wall thickness of pipe, because the addition of such otherwise desirable elements may affect the weldability of the pipe.

6.1.2 Elements Analyzed

As a minimum, each required analysis shall include the following elements:

- Carbon, manganese, phosphorus, sulfur, chromium, columbium [niobium], copper, molybdenum, nickel, silicon, titanium, and vanadium.
- Boron. (But if the heat analysis indicates a boron content less than 0.001%, then no boron determination is required for the product analysis.)
- Any other alloying element added during steelmaking for a purpose other than deoxidation.

6.1.3 Carbon Equivalent (PSL 2 only)

6.1.3.1 Calculation of Carbon Equivalent

For PSL 2 pipe, carbon equivalent (CE) calculations shall be based on the product analyses and shall be calculated as follows. All carbon equivalent results shall be reported:

- When the carbon content is less than or equal to 0.12%, the carbon equivalent shall be calculated using the following formula for $CE(Pcm)$ [see Note 1]:

$$CE(Pcm) = C + \frac{Si}{30} + \frac{Mn}{20} + \frac{Cu}{20} + \frac{Ni}{60} + \frac{Cr}{20} + \frac{Mo}{15} + \frac{V}{10} + 5B$$

If the heat analysis indicates a boron content less than 0.001%, then the product analysis need not include boron, and the boron content can be considered as zero for the $CE(Pcm)$ calculation.

- When the carbon content is greater than 0.12%, the carbon equivalent shall be calculated using the following formula for $CE(IIW)$ [see Note 2]:

$$CE(IIW) = C + \frac{Mn}{6} + \frac{(Cr + Mo + V)}{5} + \frac{(Ni + Cu)}{15}$$

6.1.3.2 Maximum Carbon Equivalent

The carbon equivalent shall not exceed the following:

- For Grade X80 pipe, for all grades of seamless pipe having a specified wall thickness greater than 0.800 in. (20.3 mm), and for pipe designated by the purchaser as high carbon equivalent pipe, the value agreed upon between the purchaser and the manufacturer.
- For pipe not covered in Item a above, a $CE(Pcm)$ of 0.25% or a $CE(IIW)$ of 0.43%, whichever is applicable.

Note 1: The $CE(Pcm)$ formula for low carbon steel is commonly called the Ito-Bessyo formula. $CE(Pcm)$ is in fact the chemical portion of the full formula. Reference: Y. Ito & K. Bessyo, "Weldability Formula of High Strength Steels Related to Heat Affected Zone Cracking," *Journal of Japanese Welding Society*, 1968, 37, (9), 938.

Note 2: The $CE(IIW)$ formula is commonly called the IIW [International Institute of Welding] formula. Reference: Technical Report, 1967, IIW doc. IX-535-67.

6.2 MECHANICAL PROPERTIES

6.2.1 Tensile Properties

PSL 1 Grades A25, A, B, X42, X46, X52, X56, X60, X65, and X70 shall conform to the tensile requirements specified in Table 3A.

PSL 2 Grades B, X42, X46, X52, X56, X60, X65, X70, and X80 shall conform to the tensile requirements specified in Table 3B.

Other grades intermediate to the listed grades between X42 and X80 shall conform to tensile requirements agreed upon between the purchaser and the manufacturer, and the requirements shall be consistent with those specified in Table 3A (for PSL 1 pipe) or Table 3B (for PSL2 pipe).

For cold expanded pipe, the ratio of body yield strength and body ultimate tensile strength of each test pipe on which body yield strength and body ultimate tensile strength are determined, shall not exceed 0.93. The yield strength shall be the tensile stress required to produce a total elongation of 0.5% of the gage length as determined by an extensometer. When elongation is recorded or reported, the record or report shall show the nominal width of the test specimen when strip specimens are used and the diameter and gage length when round bar specimens are used, or shall state when full section specimens are used. For Grade A25 pipe, the manufacturer may certify that the material furnished has been tested and meets the mechanical requirements of Grade A25.

6.2.2 Flattening Test Acceptance Criteria

Acceptance criteria for flattening tests shall be as follows:

- a. For electric welded pipe in grades higher than A25, and laser welded pipe smaller than $12^{3/4}$.
 1. For all pipe diameter-to-thickness ratios (D/t), flatten to two-thirds of the original OD without weld opening.
 2. For pipe with a D/t greater than 10, continue flattening to one-third of the original OD without cracks or breaks other than in the weld.
 3. For all pipe D/t , continue flattening until opposite walls of the pipe meet; no evidence of lamination or burnt metal shall develop during the entire test.
- b. For grade A25 welded pipe, flatten to three-fourths of the original OD without weld fracture. Continue flattening to 60% of the original OD without cracks or breaks other than in the weld.

For the purpose of mechanical testing of the weld of electric welded pipe of size $2^{3/8}$ or larger, the weld extends to a distance of $1/2$ in. (12.7 mm) on each side of the fusion line. For pipe smaller than size $2^{3/8}$, the weld extends to a distance of $1/4$ in. (6.35 mm) on each side of the fusion line.

6.2.3 Bend Tests

Welded Grade A25 pipe of size $2^{3/8}$ and smaller shall be tested according to 9.3.3. No cracks shall occur in any portion of the pipe, and no opening shall occur in the weld.

Note: For pipe smaller than size $2^{3/8}$, the weld extends to a distance of $1/4$ in. (6.35 mm) on each side of the fusion line.

6.2.4 Manipulation Tests for Submerged-Arc, Gas Metal-Arc, and Laser Welds

Submerged-arc and gas metal-arc welds in pipe of all sizes, and laser welds in pipe of sizes $12^{3/4}$ and larger, shall be tested by the guided-bend test (see 9.3.4).

6.2.5 Weld Ductility Test

For electric welded pipe in sizes $2^{3/8}$ and larger, and for laser welded pipe smaller than size $12^{3/4}$, the weld ductility shall be determined by tests on full-section specimens of 2 in. (50.8 mm) minimum length. The specimens shall be flattened cold between parallel plates. The weld shall be placed 90% from the direction of applied force (point of maximum bending). No crack or breaks exceeding $1/8$ in. (3.18 mm) in any direction in the weld or the parent metal shall occur on the outside surface until the distance between the plate is less than the value of S calculated by the following equations:

- a. Grades less than X52:

$$S = \frac{3.07t}{0.07 + 3d/D}$$

- b. Grades X52 or higher:

$$S = \frac{3.05t}{0.05 + 3t/D}$$

where

S = distance between flattening plates, in. (mm),

t = specified wall thickness of the pipe, in. (mm),

D = specified outside diameter of the pipe, in. (mm).

Cracks that originate at the edge of the specimen and are less than 0.25 in. (6.35 mm) long shall not be cause for rejection. One test shall be made on a length of pipe from each lot size as follows:

Grade	Size of Pipe	Lot Size, No. of Lengths
A25, A, and B	$2^{3/8}$ through $5^{9/16}$	400 or less
A25, A, and B	over $5^{9/16}$ through $12^{3/4}$	200 or less
X42 and higher	$2^{3/8}$ through $12^{3/4}$	200 or less
All grades	over $12^{3/4}$	100 or less

For multiple-length pipe, a length shall be considered as each section cut from a particular multiple length. The weld ductility test may also serve as one of the flattening tests of 9.3.2 by compliance with appropriate amounts of flattening.

Note: For the purpose of mechanical testing of the weld of electric welded pipe of size 2³/₈ or larger, the weld extends to a distance of 1/2 in. (12.7 mm) on each side of the fusion line.

6.2.6 Fracture Toughness Tests

6.2.6.1 Charpy Impact Tests for PSL 1

For PSL 1 pipe, Charpy impact testing is not required.

6.2.6.2 Charpy Impact Tests for PSL 2

For pipe sizes and specified wall thicknesses as given in Table 14 (pipe in size and drop-weight test and wall thickness combinations not covered by this table are not required to be tested), the manufacturer shall conduct Charpy V-notch tests that meet the following requirements. (Refer to 9.8.4 for guidance pertaining to subsize specimens.)

- a. The test temperature shall be +32°F (0°C); however, pipe tested at a lower temperature is also acceptable if it meets all other applicable fracture toughness requirements below.
- b. For all grades, the required minimum average (set of three specimens) absorbed energy for each heat based on full size specimens shall be 20 ft-lb (27 J) for transverse specimens or 30 ft-lb (41 J) for longitudinal specimens, whichever is applicable per Table 14.
- c. For X80 only, the required minimum all-heat average absorbed energy for the entire order item, based on full size Charpy specimens shall be 50 ft-lb (68 J) for transverse specimens; or 75 ft-lb (101 J) for longitudinal specimens, whichever is applicable per Table 14. If the all-heat average of the order does not meet the applicable requirement, the manufacturer shall be responsible for the replacement of heats to bring the average up to the required level.
- d. For X80 only, the required minimum shear area shall be either 40% for each heat and 70% for the all-heat average of the order based on the Charpy test, or 40% for each heat and 60% for the all-heat average based on the drop-weight tear test. The drop-weight tear test option only applies for welded pipe in sizes 20 or larger. If the all-heat average of the order does not meet the required percentage of shear area, the manufacturer shall be responsible for the replacement of heats as necessary to bring the average up to the required level.

6.2.6.3 Supplementary Fracture Toughness Tests

In addition to the requirements in 6.2.6.1 and 6.2.6.2, when so specified on the purchase order, the manufacturer shall conduct fracture toughness tests in accordance with Supplementary Requirement 5 and/or 6 (see SR5 and SR6 of Appendix F) or any combination of these, and shall furnish a report of results showing compliance with the supplementary requirements specified. The purchaser shall specify on the purchase order the testing temperature for SR5 and SR6 and the Charpy V-notch absorbed energy for SR5B.

6.2.7 Metallographic Examination

For PSL 1 electric welded pipe in grades higher than X42, for PSL 2 electric welded pipe in all grades, and for laser welded pipe in all grades, full body normalized pipe excluded, compliance with the requirement in 5.1.3.3 and 5.1.3.4 to heat treat the entire heat affected zone shall be demonstrated by metallographic examination of a weld cross section. Such examinations shall be performed at least once per operating shift (12 hours maximum) and whenever changes of grade, diameter, or wall thickness are made and whenever significant excursions from operating heat treatment conditions are encountered.

7 Dimensions, Weights, Lengths, Defects, and End Finishes

7.1 SPECIFIED DIMENSIONS

Line pipe shall be furnished in the outside diameters and wall thicknesses specified on the purchase order; such dimensions shall be in accordance with one of the following:

- a. As given in Table 4, 5, 6A, 6B, 6C, E-6A, E-6B, or E-6C, whichever is applicable.
- b. By agreement between the purchaser and the manufacturer, intermediate to the values given in Table 6A, 6B, 6C, E-6A, E-6B, or E-6C, whichever is applicable.

7.2 DIAMETER

The outside diameter shall be within the tolerances specified in Tables 7 and 8. For threaded pipe, the outside diameter at the threaded ends shall be such that the thread length, L_4 , and the number of full-crest threads in that length are within the applicable dimensions and tolerances specified in API Standard 5B.

Pipe of sizes 20 and smaller shall permit the passage over the ends, for a distance of 4 in. (101.6 mm), of a ring gage that has a bore diameter not larger than the pipe's specified outside diameter plus the applicable plus tolerance shown in Table 8. For submerged-arc welded pipe, ring gages may be slotted or notched to permit passage of the gage over the weld reinforcement. Ring gage measurements shall be made at least once per 4 hours per operating shift.

Diameter measurements of pipe larger than size 20 shall be made with a diameter tape. Diameter measurements of pipe sizes 20 and smaller shall be made with a snap gage, caliper, or other device that measures actual diameter across a single plane, except that the manufacturer shall have the option of using a diameter tape. Diameter measurements shall be made at least once per 4 hours per operating shift.

Any pipe found to be out of tolerance is cause for individual diameter measurement of all pipe back to the last, and up to the next, two sequential pipes measured and found to be within tolerance.

By agreement between the purchaser and the manufacturer, the tolerances on the outside diameter at the pipe ends may be applied instead to the inside diameter at the pipe ends.

7.3 WALL THICKNESS

Each length of pipe shall be measured for conformance to the specified wall thickness requirements. The wall thickness at any location shall be within the tolerances specified in Table 9, except that the weld area shall not be limited by the plus tolerance. Wall thickness measurements shall be made with a mechanical caliper or with a properly calibrated nondestructive inspection device of appropriate accuracy. In case of dispute, the measurement determined by use of the mechanical caliper shall govern. The mechanical caliper shall be fitted with contact pins having circular cross sections of $\frac{1}{4}$ in. (6.35 mm) diameter. The end of the pin contacting the inside surface of the pipe shall be rounded to a maximum radius of $1\frac{1}{2}$ in. (38.10 mm) for pipe of size $6\frac{5}{8}$ or larger, and to a maximum radius of $d/4$ for pipe smaller than size $6\frac{5}{8}$, with a minimum radius of $\frac{1}{8}$ in. (3.2 mm). The end of the pin contacting the outside surface of the pipe shall be either flat or rounded to a radius of not less than $1\frac{1}{2}$ in. (38.10 mm).

7.4 WEIGHT

Each length of pipe of size $5\frac{9}{16}$ or larger shall be weighed separately; lengths of pipe smaller than size $5\frac{9}{16}$ shall be weighed either individually or in convenient groups, at the option of the manufacturer. For all sizes of pipe, the order item weights and, where applicable, the carload weights shall be determined. Threaded-and-coupled pipe shall be weighed with the couplings screwed on but without thread protectors, except for carload determinations for which proper allowance shall be made for the weight of the thread protectors. Threaded-and-coupled pipe may be weighed before the couplings are attached, provided that allowance is made for the weight of the couplings.

For plain-end pipe, the weights determined as described above shall conform to the calculated weights, within the tolerances specified in Table 10. For threaded-and-coupled pipe, the weights determined as described above shall conform to the calculated weights or adjusted calculated weights, within the tolerances specified in Table 10.

Full-length calculated weights shall be determined in accordance with the following equation:

$$W_L = (w_{pe} \times L) + e_w$$

where

W_L = calculated weight of a piece of pipe of length L , lb (kg),

w_{pe} = plain-end weight per unit length rounded to the nearest 0.01 lb/ft (0.01 kg/m),

L = length of pipe, including end finish, as defined in 7.5, ft (m),

e_w = weight gain or loss due to end finish, lb (kg).

For plain-end pipe, e_w equals 0.

The plain-end weight per unit length, w_{pe} , shall be calculated using the following equation and rounded to the nearest 0.01 lb/ft (0.01 kg/m):

U.S. Customary unit equation (lb/ft) = $w_{pe} = 10.69 (D-t)t$

SI unit equation (kg/m) = $w_{pe} = 0.024 66(D-t)t$

where

D = specified outside diameter, in. (mm),

t = specified wall thickness, in. (mm).

7.5 LENGTH

Unless otherwise agreed between the purchaser and the manufacturer, pipe shall be furnished in the nominal lengths and within the length tolerances shown in Table 11, as specified on the purchase order. For threaded-and-coupled pipe, the length shall be measured to the outer face of the coupling. The length of threaded-and-coupled pipe may be determined before the couplings are attached, provided that proper allowance is made for the length of the couplings. Each length of pipe shall be measured, except that pipe made in lengths that are uniform within 0.1 ft (0.03 m) need not be individually measured, provided that the accuracy of the length is verified at least once per 4 hours per operating shift. Any pipe found to be out of tolerance is cause for individual measurement of all pipe back to the last, and up to the next, two sequential pipes measured and found to be within tolerance.

The accuracy of length measuring devices for lengths of pipe less than 100 ft (30 m) shall be ± 0.1 ft (0.03 m).

7.6 STRAIGHTNESS

Pipe smaller than size $4\frac{1}{2}$ in Grades A25, A, and B shall be reasonably straight. All other pipe shall be randomly checked for straightness; deviation from a straight line shall not exceed 0.2% of the length. Measurement may be made using a taut string or wire from end to end along the side of the pipe, measuring the greatest deviation.

7.7 JOINTERS

When specified on the purchase order, jointers (two lengths of pipe coupled together by the manufacturer or two lengths of pipe welded together by the manufacturer in accordance with the requirements of Appendix A) may be furnished; however, no length used in making a jointer shall be less than 5.0 ft (1.52 m).

For helical seam submerged-arc welded pipe, the junctions of skelp end welds and helical seam welds shall be permitted only at distances greater than 12 in. (304.8 mm) from jointer welds. By agreement between the purchaser and the manufacturer, skelp end welds in finished pipe shall be permitted at jointer welds, provided that there is a circumferential separation of at least 6 in. (152.4 mm) between the junction of the skelp end weld and the jointer weld and the junction of the helical seam and the jointer weld.

Double joints are not within the purview of API Specification 5L. Double joints are defined as lengths of pipe welded together by parties other than the manufacturer or lengths welded together by the manufacturer in accordance with requirements other than those in Appendix A.

7.8 WORKMANSHIP AND DEFECTS

Imperfections of the types described in 7.8.1–7.8.14 that exceed the specified criteria shall be considered defects. The manufacturer shall take all reasonable precautions to minimize recurring imperfections, damage, and defects.

7.8.1 Dents

The pipe shall contain no dents greater than $\frac{1}{4}$ in. (6.35 mm), measured as the gap between the lowest point of the dent and a prolongation of the original contour of the pipe. The length of the dent in any direction shall not exceed one-half the diameter of the pipe. All cold-formed dents deeper than $\frac{1}{8}$ in. (3.18 mm) with a sharp bottom gouge shall be considered a defect. The gouge may be removed by grinding.

7.8.2 Offset of Plate Edges

For pipe with filler metal welds having specified wall thicknesses of 0.500 in. (12.7 mm) and less, the radial offset (misalignment) of plate edges in the weld seams shall not be greater than $\frac{1}{16}$ in. (1.59 mm). For pipe with filler metal welds having specified wall thicknesses over 0.500 in. (12.7 mm), the radial offset shall not be greater than $0.125 t$ or $\frac{1}{8}$ in. (3.18 mm), whichever is smaller. For electric welded pipe, the radial offset of plate edges plus flash trim shall be no greater than 0.060 in. (1.52 mm). For laser welded pipe, the radial offset of plate edges plus weld reinforcement trim shall be no greater than 0.060 in. (1.52 mm).

7.8.3 Out-of-Line Weld Bead for Pipe with Filler Metal Welds

Out-of-Line weld bead (off-seam weld) shall not be cause for rejection, provided that complete penetration and complete fusion have been achieved, as indicated by nondestructive inspection.

7.8.4 Height of Outside and Inside Weld Beads—Submerged-Arc Welds

The weld bead shall not extend above the prolongation of the original surface of the pipe by more than the following:

Specified Wall Thickness	Maximum Height of Weld Bead
$\frac{1}{2}$ in. (12.70 mm) and under	$\frac{1}{8}$ in. (3.18 mm)
Over $\frac{1}{2}$ in. (12.70 mm)	$\frac{3}{16}$ in. (4.76 mm)

Weld beads higher than permitted by the requirements of this paragraph may be ground to acceptable limits at the option of the manufacturer.

The height of the weld bead shall in no case come below a prolongation of the surface of the pipe (outside or inside the weld bead) except that contouring by grinding, otherwise covered in this specification, shall be permitted.

7.8.5 Height of Flash of Electric Welded Pipe

The outside flash of electric welded pipe shall be trimmed to an essentially flush condition.

The inside flash of electric welded pipe shall not extend above the prolongation of the original inside surface of the pipe more than 0.060 in. (1.52 mm).

7.8.6 Height of Weld Reinforcement of Laser Welded Pipe

The outside weld reinforcement of laser welded pipe shall be trimmed to an essentially flush condition. The inside weld reinforcement of laser welded pipe shall not extend above the prolongation of the original inside surface of the pipe more than 0.060 in. (1.52 mm). Laser welds may have underfills, which are acceptable within the limits of 7.8.13.

7.8.7 Trim of Inside Flash of Electric Welded Pipe and Trim of Inside Weld Reinforcement of Laser Welded Pipe

The depth of groove resulting from removal of the internal flash of electric welded pipe or removal of the internal weld reinforcement of laser welded pipe shall not be greater than that listed below for the various wall thicknesses. Depth of groove is defined as the difference between the wall thickness measured approximately 1 in. (25.4 mm) from the weld line and the remaining wall under the groove.

Specified Wall Thickness (t)	Maximum Depth of Trim
≤ 0.150 in. (3.8 mm)	$0.10 t$
> 0.150 in. (3.8 mm) and < 0.301 in. (7.6 mm)	0.015 in. (0.38 mm)
≥ 0.301 in. (7.6 mm) and greater	$0.05 t$

7.8.8 Hard Spots

Any hard spot having a minimum dimension greater than 2 in. (50.8 mm) in any direction and a hardness greater than or equal to 35 HRC (327 HB) shall be rejected. The section of pipe containing the hard spot shall be removed as a cylinder.

The surface of cold-formed welded pipe shall be examined visually to detect irregularities in the curvature of the pipe. When this examination fails to disclose mechanical damage as the cause of the irregular surface but indicates that the irregular surface may be attributed to a hard spot, the hardness and dimensions of the area shall be determined. If hardness and dimensions exceed the aforementioned rejection criteria, the hard spot shall be removed.

7.8.9 Cracks, Sweats, and Leaks

All cracks, sweats, and leaks shall be considered defects.

7.8.10 Laminations (See Note)

Any lamination or inclusion extending into the face or bevel of the pipe and having a visually determined transverse dimension exceeding $\frac{1}{4}$ in. (6.35 mm) is considered a defect. Pipe containing such defects shall be cut back until no lamination or inclusion is greater than $\frac{1}{4}$ in. (6.35 mm).

Any lamination in the body of the pipe exceeding both of the following is considered a defect:

- Greater than or equal to $\frac{3}{4}$ in. (19.0 mm) in the minor dimension.
- Greater than or equal to 12 in.² (7742 mm²) in area.

Disposition of such defects shall be in accordance with 9.7.6, Item c or d. No specific inspection by the manufacturer is required unless the purchaser specifies special nondestructive inspection on the purchase order.

Note: A lamination is an internal metal separation creating layers generally parallel to the surface.

7.8.11 Arc Burns

Arc burns are localized points of surface melting caused by arcing between electrode or ground and pipe surface and shall be considered defects (see note).

Disposition of pipe containing arc burns shall be in accordance with 9.7.6, except that removal of defects by grinding shall be subject to the following additional condition. Arc burns may be removed by grinding, chipping, or machining. The resulting cavity shall be thoroughly cleaned and checked for complete removal of damaged material by etching with a 10% solution of ammonium persulfate or a 5% solution of nital.

Note: Contact marks, defined as intermittent marks adjacent to the weld line, resulting from the electrical contact between the electrodes supplying the welding current and the pipe surface, are not defects.

7.8.12 Undercuts

Undercutting of submerged-arc or gas metal-arc welded pipe is the reduction in thickness of the pipe wall adjacent to the weld where it is fused to the surface of the pipe. Undercutting can best be located and measured visually.

a. Minor undercutting on either the inside or the outside of the pipe is defined as follows and is acceptable without repair or grinding:

- Maximum depth of $\frac{1}{32}$ in. (0.79 mm) and not exceeding 12 $\frac{1}{2}$ % of the specified wall thickness with a maximum length of one-half the specified wall thickness and not more than two such undercuts in any 1 ft (0.30 m) of the weld length.
- Maximum depth of $\frac{1}{64}$ in. (0.40 mm) any length.

b. Undercutting not classified as minor shall be considered a defect. Disposition shall be as follows:

- Undercut defects not exceeding $\frac{1}{32}$ in. (0.79 mm) in depth and not exceeding 12 $\frac{1}{2}$ % of the specified wall thickness shall be removed by grinding in accordance with 9.7.6, Item a.
- Disposition of undercuts greater in depth than $\frac{1}{32}$ in. (0.79 mm) or 12 $\frac{1}{2}$ % of the specified wall thickness shall be in accordance with 9.7.6, Item b, c, or d.

7.8.13 Underfills

Underfill of laser welded pipe is a depression on the weld face or root surface extending below the adjacent surface of the base metal. Underfills can best be located visually.

a. Underfills on the inside of the pipe shall be considered a defect.

b. Minor underfills on the outside of the pipe are defined as follows and are acceptable without repair or grinding.

- Maximum depth not exceeding 5% of the specified wall thickness with a maximum length of two times the specified wall thickness, with a remaining wall thickness of 87 $\frac{1}{2}$ % of the specified wall thickness, and not more than two such underfills in any 1 ft (0.30 m) of weld length. Furthermore, the coincident combination of underfills, other imperfections, grinds, and weld trim on the outside and inside surfaces of laser welded pipe shall not reduce the remaining wall thickness to less than that permitted in Table 9.
- Maximum depth of $\frac{1}{64}$ in. (0.40 mm), any length.

c. Disposition of external underfills that are not classified as minor shall be in accordance with 9.7.6 except that the length of grind to remove underfills shall not exceed 6 in. (152.4 mm) in any 1 ft (0.30 m) of weld length or 12 in. (0.30 m) in any 5 ft (1.52 m) of weld length. Disposition of internal underfills shall be in accordance with 9.7.6, Items b, c, or d.

7.8.14 Other Defects

Any imperfection having a depth greater than $12\frac{1}{2}\%$ of the specified wall thickness, measured from the surface of the pipe, shall be considered a defect.

7.9 PIPE ENDS

7.9.1 General

The pipe ends shall be plain, threaded, belled, or prepared for special couplings, as specified on the purchase order. Helical seam pipe shall not be threaded. The inside and outside edges of the ends of all pipe shall be free of burrs.

7.9.2 Threaded Ends (PSL 1 only)

Threaded ends shall conform to the threading, thread inspection, and gaging requirements specified in API Standard 5B. One end of each length of threaded pipe shall be provided with a coupling conforming to the requirements of Section 8, in effect at the date of manufacture of each coupling (see Note 1), and the other end with thread protection conforming to the requirements of 11.2. Couplings shall be screwed onto the pipe handling-tight (see Note 2), except that they shall be applied power-tight if so specified on the purchase order. A thread compound shall be applied to cover the full surface of either the coupling or pipe engaged thread before making up the joint. All exposed threads shall be coated with this thread compound. Unless otherwise specified on the purchase order, the manufacturer may use any thread compound that meets the performance objectives set forth in API RP 5A3. A storage compound of distinct color may be substituted for this thread compound on all exposed threads. Whichever compound is used shall be applied to a surface that is clean and reasonably free of moisture and cutting fluids.

Notes:

1. Unless otherwise specified on the purchase order, it is not mandatory that both the pipe and coupling of each threaded and coupled product be manufactured to the same edition of this specification.
2. Handling-tight shall be defined as sufficiently tight that the coupling cannot be removed except by using a wrench. The purpose of making up couplings handling-tight is to facilitate removal of the couplings for cleaning and inspecting threads and applying fresh thread compound before laying the pipe. This procedure has been found necessary to prevent thread leakage, especially in gas lines, because manufacturer-applied couplings made up power-tight, although leak-proof at the time of makeup, may not always remain so after transportation, handling, and laying.

7.9.3 Plain Ends

Unless otherwise specified on the purchase order, plain-end pipe shall be furnished with ends beveled to an angle of 30 degrees (+ 5 degrees, – 0 degrees) measured from a line

drawn perpendicular to the axis of the pipe, and with a root face of $\frac{1}{16}$ in. \pm $\frac{1}{32}$ in. (1.59 ± 0.79 mm) (see note). For seamless pipe where internal machining is required to maintain the root face tolerance, the angle of the internal taper, measured from the longitudinal axis, shall be no larger than the following:

Specified Wall Thickness, in. (mm)	Maximum Angle of Taper (degrees)
Less than 0.418 (10.6)	7
0.418 through 0.555 (10.6 through 14.1)	$9\frac{1}{2}$
0.556 through 0.666 (Greater than 14.1 through 16.9)	11
Over 0.666 (16.9)	14

For the removal of an internal burr on welded pipe larger than size $4\frac{1}{2}$, the internal taper, measured from the longitudinal axis, shall be no larger than 7° .

For pipe sizes $2\frac{3}{8}$ and larger, the pipe ends shall be cut square within $\frac{1}{16}$ in. (1.59 mm). Pipe ends from each end-finishing machine shall be checked for compliance at least once per 4 hours per operating shift.

Both ends of pipe with filler metal welds shall have the inside reinforcement removed for a distance of approximately 4 in. (101.6 mm) from the end of the pipe.

Note: The purchaser is directed to the applicable code for the recommended angle of pipe bevel.

7.9.4 Belled Ends (PSL 1 only)

When so specified on the purchase order, pipe with specified wall thickness 0.141 in. (3.6 mm) and less shall be furnished with one end belled for bell and spigot joints in accordance with Figure 1. The belled end shall be visually inspected for workmanship and defects.

7.9.5 Ends Prepared for Special Couplings (PSL 1 only)

When so specified on the purchase order, pipe shall be furnished with ends suitable for use with special couplings such as Dresser, Victaulic, or other equivalent special couplings. Such pipe shall be sufficiently free from indentations, projections, or roll marks for a distance of 8 in. (203 mm) from the end of the pipe to permit proper makeup of coupling.

8 Couplings (PSL 1 only)

8.1 MATERIAL

Couplings for Grades A and B pipe shall be seamless and shall be made of a grade of material at least equal in mechanical properties to that of the pipe. Couplings for Grade A25

pipe shall be seamless or welded and shall be made of steel. By agreement between the purchaser and the manufacturer, welded couplings may be supplied on pipe of sizes 14 and larger, if the couplings are properly marked.

8.2 TENSILE TESTS

A tensile test shall be made on each heat of steel from which couplings are produced, and the coupling manufacturer shall maintain a record of such tests. This record shall be open to inspection by the purchaser. If such a test is made on finished couplings, either round specimens proportioned as specified in ASTM E 8, *Test Methods for Tension Testing of Metallic Materials*, or strip specimens shall be used at the option of the manufacturer.

8.3 DIMENSIONS

Couplings shall conform to the dimensions and tolerances shown in Table 12 (see note) and Figure 2.

Note: Couplings given in Table 12 are suitable for pipe having dimensions as given in Tables 4 and 5.

8.4 INSPECTION

Couplings shall be free from blisters, pits, cinder marks, and other defects that would impair the efficiency of the coupling or break the continuity of the thread.

9 Inspection and Testing

9.1 TEST EQUIPMENT

If test equipment, whose calibration or verification is required under the provisions of the specification, is subjected to unusual or severe conditions sufficient to make its accuracy questionable, recalibration or reverification shall be performed prior to further use of the equipment.

9.2 TESTING OF CHEMICAL COMPOSITION

9.2.1 Heat Analyses

The steel manufacturer shall determine the analysis of each heat of steel used in the manufacture of pipe specified on the purchase order. The analysis so determined shall conform to the requirements of 6.1.1.

For Grade X80, heat analysis limits have not been defined, only product analysis limits.

9.2.2 Product Analyses

9.2.2.1 Sampling Frequency

The manufacturer shall determine the analysis of two samples representing each heat of steel used for the production of pipe under this specification.

9.2.2.2 Sampling Methods

9.2.2.2.1 Seamless Pipe

At the option of the manufacturer, samples used for product analyses shall be taken either from tensile test specimens or from the finished pipe.

9.2.2.2.2 Welded Pipe

At the option of the manufacturer, samples used for product analyses shall be taken from either finished pipe, plate, skelp, tensile test specimens, or flattening test specimens. The location of the samples shall be a minimum of 90° from the weld of longitudinally welded pipe. For helical seam pipe, the sample location shall be at a position not less than one quarter of the distance between adjacent weld convolutions as measured from either edge of the weld. For pipe manufactured from plate or skelp, the product analyses may be made by the supplier of the plate or skelp providing the analyses are made in accordance with the frequency requirement of this specification.

9.2.3 Test Reports

9.2.3.1 When required by the purchaser, for Grade A25, the manufacturer shall certify that the pipe furnished was produced in conformance with the requirements for chemical properties and tests of API Specification 5L.

9.2.3.2 Chemical analyses required by this specification shall be reported to the purchaser when SR15 or PSL 2 is specified.

9.3 TESTING OF MECHANICAL PROPERTIES

9.3.1 Tensile Tests

9.3.1.1 Tensile Test Specimens

Tensile test orientation shall be as shown in Figure 3. At the option of the manufacturer for longitudinal seam welded pipe, the longitudinal specimens may be taken from the skelp parallel to the rolling direction and approximately midway between edge and center. At the option of the manufacturer, the specimen may be either full section, strip specimen, or round bar specimens as specified in 9.3.1.3, 9.3.1.4, and Figure 4. The type, size, and orientation of the specimens shall be reported. Testing of strip specimens shall be with suitable curved-face testing grips, or flat-face testing grips if the grip areas of the specimens have been machined to reduce the curvature or have been flattened without heating. For strip specimens, the specified width in the gage length shall be either 1½ in. (38.1 mm) or ¾ in. (19.0 mm) for pipe of size 3½ or smaller; either 1½ in. (38.1 mm) or 1 in. (25.4 mm) for pipe of size larger than 3½ up to size 6⅝, inclusive; and 1½ in. (38.1 mm) for pipe larger than size 6⅝.

9.3.1.2 Tensile Testing Frequency

Tensile tests shall be made at the frequency of one test per inspection lot as shown in Table 13.

9.3.1.3 Longitudinal Tensile Tests

At the option of the manufacturer, longitudinal tests may utilize a full section specimen (see Figure 4, Subfigure B), a strip specimen (see Figure 4, Subfigure C), or for pipe with wall thickness greater than 0.750 in. (19.1 mm) a 0.500-in. (12.7-mm) diameter round bar specimen (see Figure 4, Subfigure D). The strip specimen shall be tested without flattening.

9.3.1.4 Transverse Tensile Tests

The transverse tensile properties shall be determined, at the option of the manufacturer, by one of the following methods:

- a. The yield strength, ultimate tensile strength, and elongation values shall be determined on either a flattened rectangular specimen (see Figure 4, Subfigure E) or on a 0.500-in. (12.7-mm) or 0.350-in. (8.9-mm) round bar specimen (see Figure 4, Subfigure G).

The yield strength shall be determined by the ring expansion method (see Figure 4, Subfigure A) with the ultimate strength and elongation values determined from a flattened rectangular specimen.

The same method of testing shall be employed for all lots in an order item. All transverse tensile specimens shall be as shown in Figure 4. All specimens shall represent the full wall thickness of the pipe from which the specimen was cut, except for round bar tensile specimens.

Transverse round bar specimens are to be secured from nonflattened pipe sections. The 0.500-in. (12.7-mm) diameter round bar specimens shall be used when the pipe size allows, and the 0.350-in. (8.9-mm) diameter round bar specimen shall be used for other sizes. For pipe sizes too small to allow a 0.350-in. (8.9-mm) specimen, round bar tensile specimens are not permitted.

9.3.1.5 Weld Tensile Tests

Weld tensile test specimens shall be taken at 90° to the weld with the weld at the center as shown in Figures 3 and 4 and shall represent the full wall thickness of the pipe from which the specimen was cut. Weld reinforcement may be removed at the manufacturer's option. Weld tensile tests need not include determination of yield strength and elongation.

9.3.1.6 Control Tensile Tests

For pipe other than Grade A25, one tensile test per heat shall be made as a control, and a record of such tests shall be available to the purchaser. For longitudinal seam welded pipe, such tensile tests shall be made using samples taken from either plate, skelp, or finished pipe at the option of the manufacturer.

9.3.2 Flattening Tests

Flattening tests shall be performed for electric welded, continuous welded, and laser welded pipe. Frequency of testing, sample location, test orientation, and applicable pipe sizes shall be as shown in Figure 5. For electric welded pipe that is to be processed through a hot stretch mill, the flattening test specimens shall be obtained either prior to or after such treatment, at the option of the manufacturer.

9.3.3 Bend Tests

One full section specimen of appropriate length, cut from a length of pipe from each lot of 25 tons (22.7 Mg), or fraction thereof, for pipe of nominal size 1.900 and smaller, and from each lot of 50 tons (45.5 Mg), or fraction thereof, for pipe of size $2\frac{3}{8}$ shall be bent cold through 90°, around a mandrel having a diameter not greater than twelve times the outside diameter of the pipe being tested, with the weld located approximately 45° from the point of contact of the specimen with the mandrel.

9.3.4 Guided-Bend Tests

The test specimens shall be taken from the helical or each longitudinal seam weld in a length of pipe from each lot of 50 lengths or less of each combination of specified outside diameter, specified wall thickness, and grade; and from a skelp end weld in a length of pipe from each lot of 50 lengths or less of each combination of specified outside diameter, specified wall thickness, and grade of finished helical seam pipe containing skelp end welds. The test specimens shall not contain repair welds.

9.3.5 Fracture Toughness Tests

9.3.5.1 Charpy Test Specimens

The Charpy test specimens shall be prepared in accordance with ASTM A 370, *Methods and Definitions for Mechanical Testing of Steel Products*. The specimen size and orientation shall be as given in Table 14, except that it shall be permissible to use $\frac{2}{3}$ or $\frac{1}{2}$ size test specimens as required when the absorbed energy is expected to exceed 80% of the full scale capacity of the testing machine. The Charpy specimens shall be taken from the body of the pipe. For welded pipe, the location shall be 90° from the weld seam. Notch orientation shall be through the wall thickness as shown in Figure F-3 of Appendix F.

9.3.5.2 Charpy Testing Frequency

The minimum test frequency shall be one test per heat per combination of pipe size and specified wall thickness. An impact test shall consist of three specimens; the reported results shall be the three individual specimen values and the average of the three specimens.

9.3.5.3 Drop-Weight Tear Test Specimen and Test Frequency

When the drop-weight tear test option is selected (see 6.2.6.3), refer to SR6.

9.4 HYDROSTATIC TESTS

9.4.1 Hydrostatic Test Requirements

Each length of pipe shall withstand, without leakage, an inspection hydrostatic test to at least the pressure specified in 9.4.3. Test pressures for all sizes of seamless pipe and for welded pipe in sizes 18 and smaller, shall be held for not less than 5 seconds. Test pressures for welded pipe in sizes 20 and larger shall be held for not less than 10 seconds. For threaded-and-coupled pipe, the test shall be applied with the couplings made up power-tight if power-tight makeup is specified on the purchase order, except that pipe sizes larger than 12³/₄ may be tested in the plain-end condition. For threaded pipe furnished with couplings made up handling-tight, the hydrostatic test shall be made on the pipe in the plain-end or threads-only condition or with couplings applied, unless otherwise agreed by the purchaser and the manufacturer.

9.4.2 Verification of Hydrostatic Test

In order to ensure that every length of pipe is tested to the required test pressure, each tester (except those on which continuous welded pipe is tested) shall be equipped with a recording gage that will record the test pressure and duration of time the pressure is applied to each length of pipe, or shall be equipped with some positive and automatic or interlocking device to prevent pipe from being classified as tested until the test requirements (pressure and time) have been complied with. Such records or charts shall be available for examination at the manufacturer's facility by the purchaser's inspectors. The test pressure measuring device shall be calibrated by means of a dead weight tester, or equivalent, within the 4 months prior to each use. Retention of calibration records shall be as specified in 12.2.

9.4.3 Test Pressures

The minimum test pressure shall be the standard test pressure given in Tables 4, 5, 6A, 6B, 6C, E-6A, E-6B, or E-6C; the alternative test pressure given in Tables 6A, 6B, 6C, E-6A, E-6B, or E-6C if so specified in the purchase order; a pressure higher than standard, at the discretion of the manufacturer unless specifically limited by the purchaser; or a pressure higher than standard, as agreed between the purchaser and the manufacturer (see Note 1). The minimum test pressures for grades, outside diameters, and specified wall thicknesses not listed shall be computed by the equation given in Note 2 below. For all sizes of Grade A25 pipe smaller than 5⁹/₁₆ and

all sizes of Grade A and B pipe smaller than 2³/₈, the test pressure has been arbitrarily assigned. Where the unlisted wall thickness is intermediate to wall thicknesses whose test pressures have been arbitrarily assigned, the test pressure for the intermediate wall thickness shall be equal to the test pressure specified for the next heavier wall thickness. When computed pressures are not an exact multiple of 10 psi (100 kPa), they shall be rounded to the nearest 10 psi (100 kPa).

When the purchase order specifies a hydrostatic test pressure that will produce a hoop stress greater than 90% of the specified minimum yield strength, by agreement between the purchaser and the manufacturer, the hydrostatic test pressure shall be determined in accordance with Appendix K.

Note 1: The hydrostatic test pressures given herein are inspection test pressures, are not intended as a basis for design, and do not necessarily have any direct relationship to working pressures.

Note 2: The test pressures given in Tables 4, 5, 6A, 6B, 6C, E-6A, E-6B, and E-6C were computed by the following equations (see Footnotes a through d) and rounded to the nearest 10 psi (100 kPa):

U.S. Customary Unit Equation

$$P = \frac{2St}{D}$$

SI Unit Equation

$$P = \frac{2000St}{D}$$

where

P = hydrostatic test pressure in psi (kPa),

S = fiber stress in psi (MPa), equal to a percentage of the specified minimum yield strength for the various sizes as shown in the tabulation below,

t = specified wall thickness, in. (mm),

D = specified outside diameter, in. (mm).

Grade	Size	Percent of Specified Minimum Yield Strength	
		Standard Test Pressure	Alternative Test Pressure
A25	5 ⁹ / ₁₆ ^a	60	—
A	≥ 2 ³ / ₈ ^b	60	75
B	≥ 2 ³ / ₈ ^b	60	75
X42 through X80	≤ 5 ⁹ / ₁₆	60 ^c	75 ^d
	> 5 ⁹ / ₁₆ and ≤ 8 ⁵ / ₈	75 ^c	75 ^d
	> 8 ⁵ / ₈ and < 20	85 ^c	85 ^d
	≥ 20	90 ^c	90 ^d

^aTest pressures were limited to 2,800 psi (19 300 kPa). Test pressures for other sizes were established arbitrarily.

^bTest pressures were limited to 2,500 psi (17 200 kPa) for 3¹/₂ and smaller, and to 2,800 psi (19 300 kPa) for sizes larger than 3¹/₂. Test pressures for other sizes were established arbitrarily.

^cTest pressures for Grades X42 through X80 were limited to 3,000 psi (20 700 kPa) to accommodate hydrostatic tester limitations.

^dTest pressures for Grades X42 through X80 were limited to 7,260 psi (50 000 kPa) for sizes < 16 and 3,630 psi (25 000 kPa) for sizes ≥ 16.

9.4.4 Supplementary Hydrostatic Tests

By agreement between the purchaser and the manufacturer, for Grade X42 and higher, the manufacturer shall make additional internal pressure tests, which may involve one or more of the following methods. In all supplementary hydrostatic tests, the formula shown in 9.4.3 shall be used for stress calculations. The conditions of testing shall be as agreed upon.

- a. Hydrostatic destructive tests in which the minimum length of the specimen is ten times the outside diameter of the pipe, but need not exceed 40 ft (12.2 m).
- b. Full-length destructive tests made by the hydrostatic pressure water column method.
- c. Hydrostatic transverse yield strength tests using accurate strain gages (see note).

Note: Acceptable gages are the roller-chain ring-expansion gage, the metallic bonded resistance strain gage, or other suitable gages of similar accuracy.

9.5 DIMENSIONAL TESTING

The accuracy of all measuring instruments used for acceptance or rejection, except ring and plug thread gages and weighing devices, shall be verified at least once per operating shift (12 hours maximum).

Verifying the accuracy of measuring devices such as snap gages and drift mandrels shall consist of inspection for wear and conformance to specified dimensions. Verifying the accuracy of rules, length measuring tapes, and other nonadjustable measuring devices shall consist of a visual check for legibility of markings and general wear of fixed reference points. The adjustable and nonadjustable designation of measuring devices utilized by the manufacturer shall be documented.

The verification procedure for working ring and plug thread gages shall be documented. The accuracy of all weighing devices shall be verified at periods not to exceed those required by the manufacturer's documented procedure in accordance with National Institute of Standards and Technology (NIST) standards or equivalent regulations in the country of manufacture of products made to this specification.

If measuring equipment, whose calibration or verification is required under the provisions of the specification, is subjected to unusual or severe conditions sufficient to make its accuracy questionable, recalibration or reverification shall be performed before using the equipment.

9.6 VISUAL INSPECTION

All pipe shall be visually examined and shall be free of defects in the finished condition.

9.7 NONDESTRUCTIVE INSPECTION

9.7.1 Purchaser Inspection

When inspection by the purchaser is stated on the purchase order, the provisions of Appendix H shall apply.

9.7.2 Methods of Inspection

Except for Grade A25 pipe, the weld seams of welded pipe of sizes $2\frac{3}{8}$ and larger shall be inspected full length (100%) in accordance with the methods specified below. In addition, the skelp end weld in finished helical seam pipe shall be so inspected.

The location of equipment in the manufacturer's facility shall be at the discretion of the manufacturer, except that final inspection of weld seams of cold expanded pipe shall be performed after cold expansion.

9.7.2.1 Submerged-arc welds shall be inspected by radiological methods in accordance with 9.7.3.1 through 9.7.3.12. Such inspection shall be full length or for a minimum distance of 8 in. (203 mm) from each end if the balance of the weld length is inspected by ultrasonic methods in accordance with 9.7.4.1 through 9.7.4.4.

9.7.2.2 Electric welds shall be inspected by ultrasonic or electromagnetic methods in accordance with 9.7.4.1 through 9.7.4.4. If necessary to meet the full length (100%) inspection requirements of 9.7.2, pipe ends shall be inspected by using hand-held ultrasonic shear wave equipment or other NDT method agreed to by the manufacturer and the purchaser.

By agreement between the purchaser and the manufacturer and when specified on the purchase order, electric welds shall be nondestructively inspected in accordance with SR17 (see Appendix F).

9.7.2.3 Laser welds shall be inspected by ultrasonic methods in accordance with 9.7.4.1 through 9.7.4.4. If necessary to meet the full length (100%) inspection requirements of 9.7.2, pipe ends shall be inspected by using hand-held or automatic ultrasonic shear wave equipment, or other NDT method agreed to by the manufacturer and the purchaser.

By agreement between the purchaser and the manufacturer and when specified on the purchase order, laser welds shall be ultrasonically inspected in accordance with SR17 (see Appendix F).

9.7.2.4 Gas metal-arc welds shall be inspected full length by ultrasonic methods in accordance with 9.7.4.1 through 9.7.4.4. In addition, the weld at each end of the pipe shall be inspected by radiological methods in accordance with 9.7.3.1 through 9.7.3.12 for a minimum distance of 8 in. (203 mm) from each end.

9.7.2.5 Skelp end welds in finished helical seam pipe shall have been inspected in accordance with one or more of the

methods specified above for the weld type. Radiological inspection shall include the junction of the skelp end weld with the helical seam weld. For cold expanded pipe, radiological inspection shall be performed after expansion.

9.7.2.6 All PSL 2 seamless pipe and PSL 1 Grade B quenched and tempered seamless pipe (see 5.4) shall be non-destructively inspected in accordance with SR4 (see Appendix F). By agreement between the purchaser and the manufacturer and when specified on the purchase order, other PSL 1 seamless pipe shall be nondestructively inspected in accordance with SR4 (see Appendix F).

9.7.3 Radiological Inspection

9.7.3.1 Radiological Inspection Equipment

The homogeneity of weld seams examined by radiological methods shall be determined by means of X-rays directed through the weld material in order to create a suitable image on radiographic film or fluorescent screen or a television screen, provided adequate sensitivity can be obtained.

9.7.3.2 Fluoroscopic Operator Qualification

Operators of fluoroscopic equipment shall be trained, tested, and certified by the pipe manufacturer.

Details of such training, testing, and certification programs shall be available to the purchaser. This program shall include the following:

- a. Classroom instruction in the fundamentals of radiological inspection techniques.
- b. On-the-job training designed to familiarize the operator with specific installations, including the appearance and interpretation of weld imperfections and defects. The duration of such training shall be sufficient to ensure adequate assimilation of the knowledge required for conducting the inspection.
- c. Knowledge of appropriate requirements of this specification.
- d. A physical examination at least once per year to determine the operator's optical capability to perform the required inspection.
- e. Upon completion of Items a and b above, an examination shall be given by the manufacturer to determine if the operator is qualified to properly perform fluoroscopic examinations.

9.7.3.3 Operation Certification

Certified operators whose work has not included fluoroscopic inspection for a period of one year or more shall be recertified by successfully completing the examination (Item e above) and also passing the physical examination (Item d above). Substantial changes in procedure or equipment shall require recertification of the operators.

9.7.3.4 NDT Reference Standards

Unless otherwise specified, the reference standard shall be the API standard penetrometer described in 9.7.3.5, or at the option of the manufacturer the ISO wire penetrometer described in 9.7.3.6. By agreement between the purchaser and the manufacturer, other standard penetrameters may be used.

9.7.3.5 API Standard Penetrameter

The API standard penetrometer shall be as shown in Figure 6 and made of a material with the same radiological characteristics as the pipe. The thickness of the penetrometer shall be a maximum of 4% of the specified wall thickness. Either 2% or 4% penetrameters may be used (see Tables 15 and 16 for sizes).

9.7.3.6 ISO Wire Penetrameter

The ISO wire penetrometer shall be Fe 1/7, Fe 6/12, or Fe 10/16 in accordance with Tables 17 and 18 for the appropriate wall thickness. When the wire penetrometer is placed across the weld, the diameter of the wire employed shall be based on the specified wall thickness plus the estimated thickness of the weld reinforcement (not to exceed the maximum allowed) at the penetrometer location. When the penetrometer is placed on the base metal, the diameter of the wire employed shall be based on the specified wall thickness.

9.7.3.7 Frequency of Calibration

When the fluoroscopic method is used full length and on each film when film is used, the penetrometer shall be used to check the sensitivity and adequacy of the radiographic technique on one pipe in every lot of 50 pipe, at least once per 4 hours per operating shift. When film is used full length, one penetrometer shall be used for each length of pipe. The pipe shall be held in a stationary position during the adjustment of the radiographic technique by use of the penetrometer. Proper definition and sensitivity is attained when all three holes of the API standard penetrometer or individual wires of the ISO penetrometer are clearly discernible.

9.7.3.8 Procedure for Evaluating In-Motion Operation of a Fluoroscope

To evaluate the definition of defects at operational speeds, a pipe section having a minimum wall thickness of 0.375 in. (9.5 mm) shall be used. Series of $\frac{1}{32}$ in. (0.79 mm) holes, as shown in Example 6 of Figure 7 shall be drilled into the center of the weld to a depth of 100% of the total thickness. At least four such series shall be used, spaced 1 foot apart. As an alternative to the use of the pipe section described above, a penetrometer as described in 9.7.3.4, 9.7.3.5, and 9.7.3.6 may be used at the option of the manufacturer. The speed of operation shall be adjusted so that the holes in the pipe section or

API penetrometer, or individual wires in the ISO penetrometer, are clearly visible to the operator.

9.7.3.9 Acceptance Limits for Radiological Inspection

Radiological examination shall be capable of detecting weld imperfections and defects as described in 9.7.3.10 and 9.7.3.11.

9.7.3.10 Imperfections Observed During Radiological Inspection

The maximum acceptable size and distribution of slag inclusion and/or gas pocket discontinuities are shown in Tables 19 and 20 and Figures 7 and 8 (see note).

The important factors to be considered in determining rejection or acceptance limits are size and spacing of discontinuities and the sum of the diameters in an established distance. For simplicity, the distance is established as any 6 in. (152.4 mm) length. Discontinuities of this type usually occur in an aligned pattern, but no distinction is made between aligned or scattered patterns. Also, the distribution pattern may be of assorted sizes.

Note: Unless the discontinuities are elongated, it cannot be determined with assurance whether the radiological indications represent slag inclusions or gas pockets. Therefore, the same limits apply to all circular-type discontinuities.

9.7.3.11 Defects Observed During Radiological Inspection

Cracks, lack of complete penetration, lack of complete fusion, and discontinuities greater in size and/or distribution than shown in Tables 19 and 20 and Figures 7 and 8, as indicated by radiological examination, shall be considered defects. See 9.7.6 for disposition of pipe containing defects.

9.7.3.12 Disposition of Defects Observed During Radiological Inspection

Any weld defect detected as a result of radiological examination shall be rejected. Disposition of the pipe containing the defect shall be in accordance with 9.7.6.

9.7.4 Ultrasonic and Electromagnetic Inspection

9.7.4.1 Equipment

Any equipment utilizing the ultrasonic or electromagnetic principles and capable of continuous and uninterrupted inspection of the weld seam shall be used. The equipment shall be checked with an applicable reference standard as described in 9.7.4.2 at least once per 8 hours per operating shift to demonstrate its effectiveness and the inspection procedures. The equipment shall be adjusted to produce well-defined indications when the reference standard used by the manufacturer is scanned by the inspection unit in a manner

simulating the inspection of the product and shall be capable of inspecting $\frac{1}{16}$ in. (1.6 mm) on each side of the weld line for the entire wall thickness. Restrictions on residual magnetism in pipe are given in 9.7.7.

9.7.4.2 NDT Reference Standards

Reference standards shall have the same specified diameter and thickness as the product being inspected and may be of any convenient length as determined by the manufacturer. Reference standards shall contain machined notches, one on the inside surface and one on the outside surface, or a drilled hole as shown in Figure 9, at the option of the manufacturer. The notches shall be parallel to the weld seam and shall be separated by a distance sufficient to produce two separate and distinguishable signals. The $\frac{1}{16}$ in. (1.6 mm) or $\frac{1}{8}$ in. (3.2 mm) hole shall be drilled through the wall and perpendicular to the surface of the reference standard as shown in Figure 9 (see note).

Note: The reference standards defined above are convenient standards for calibration of nondestructive testing equipment. The dimensions of these standards should not be construed as the minimum size imperfection detectable by such equipment.

9.7.4.3 Acceptance Limits

Table 21 gives the height of acceptance limit signals produced by reference standards. An imperfection that produces a signal greater than the acceptance limit signal given in Table 21 shall be considered a defect unless it can be demonstrated by the manufacturer that the imperfection does not exceed the provisions of 7.8. Alternatively, indicated imperfections in submerged-arc welds may be reinspected by film radiological methods using 2% penetrameters, in accordance with 9.7.3.1 through 9.7.3.12.

In addition, for gas metal-arc welds, continuous flaw signals greater than 1 in. in length, regardless of signal height, but greater than the background signal (noise) shall be reinspected by radiological methods in accordance with 9.7.3.1 through 9.7.3.12 or by other techniques as agreed upon between the purchaser and the manufacturer.

9.7.4.4 Weld Repair

Defects in the filler-metal welds found by ultrasonic methods of inspection may be repaired by welding and reexamined nondestructively in accordance with Appendix B.

For PSL 1 pipe, defects in weld seams made without filler metal found by ultrasonic or electromagnetic methods of inspection may be repaired by welding and reexamined nondestructively in accordance with Appendix B, only by agreement between the purchaser and the manufacturer.

For PSL 2 pipe, defects in weld seams made without filler metal shall not be repaired by welding.

9.7.5 Magnetic Particle Inspection (PSL 1 only)

Note: For weld repairs to the pipe body, as permitted in Appendix B for PSL 1 pipe.

9.7.5.1 Equipment

The equipment used for magnetic particle inspection shall produce a magnetic field of sufficient intensity to indicate weld area defects of the following character in the external surface of the pipe: open welds, partial or incomplete welds, intermittent welds, cracks, seams, and slivers.

9.7.5.2 Reference Standard

If requested by the purchaser, arrangements shall be made by the manufacturer to perform a demonstration for the purchaser or his representative during production of his order. Such demonstration shall be based on pipe in process or sample lengths of similar pipe retained by the manufacturer for that purpose that exhibit natural or artificially produced defects of the character stated in 9.7.5.1.

9.7.5.3 Acceptance Limits

The manufacturer shall mark each magnetic particle indication and subsequently explore each indication with respect to the depth of the imperfection. Imperfections that require grinding or chipping to determine their depth shall be completely removed by grinding, or by cutting off, or may be repaired by welding and reexamined nondestructively in accordance with Appendix B.

9.7.6 Disposition of Defects

Pipe containing a defect shall be given one of the following dispositions:

- The defect shall be removed by grinding in such a way that the ground area blends in smoothly with the contour of the pipe. Complete removal of the defect shall be verified by visual inspection of the ground area, and the wall thickness in the ground area shall be as specified in 7.3. (For arc burns, see also 7.8.11.)
- The defect shall be repaired by welding in accordance with Appendix B, except that, for PSL 2 pipe, defects in pipe body or in seam welds made without filler metal shall not be repaired by welding.
- The section of pipe containing the defect shall be cut off within the limits of requirements on length.
- The entire pipe shall be rejected.

9.7.7 Residual Magnetism Measurement Requirements

The requirements of this paragraph apply only to testing within the pipe manufacturing facility. Measurements of residual magnetism on pipe, subsequent to leaving the pipe manufacturing facility, may be affected by procedures and conditions imposed on the pipe during and after shipment.

a. The longitudinal magnetic field shall be measured on the root face or square cut face of finished plain-end pipe size 6⁵/₈ and larger, and all smaller plain-end pipe that is inspected full length by magnetic methods or that is handled by magnetic equipment prior to loading.

b. Measurements shall be made using a Hall-effect gaussmeter or other type of calibrated instrument. However, in case of dispute, measurements made with a Hall-effect gaussmeter shall govern. The gaussmeter shall be operated in accordance with written instructions demonstrated to produce accurate results. The accuracy shall be verified at least once each day that the gaussmeter is used.

c. Measurements shall be made on each end of a pipe to be selected at least once per 4 hours per operating shift.

d. Pipe magnetism shall be measured subsequent to any inspection that utilizes a magnetic field, prior to loading for shipment from the manufacturer's facility. For pipe handled with electromagnetic equipment after measurement of magnetism, such handling shall be performed in a manner demonstrated not to cause residual magnetism in excess of the levels stipulated in Item e.

e. As a minimum, four readings shall be taken approximately 90° apart around the circumference of each end of the pipe. The average of the four readings shall not exceed 30 gauss (3.0 mT), and no one reading shall exceed 35 gauss (3.5 mT) when measured with a Hall-effect gaussmeter, or equivalent values when measured with other types of instruments.

f. Any pipe that does not meet the requirements of 9.7.7, Item e, shall be considered defective. In addition, all pipe produced between the defective pipe and the last acceptable pipe shall be individually measured. Alternatively, if the pipe production sequence is documented, pipe may be measured in reverse sequence beginning with the pipe produced prior to the defective pipe until at least three consecutively produced pipes meet the requirements; pipe produced prior to the three acceptable pipes need not be measured.

Pipe produced after the defective pipe shall be measured individually until at least three consecutive pipes meet the requirements.

Measurements made on pipe in stacks or bundles are not considered valid.

All defective pipe shall be degaussed full length, and remeasured until at least three consecutive pipes meet the requirements.

9.8 TEST METHODS

9.8.1 Methods of Chemical Analysis

Methods and practices relating to chemical analysis shall be performed in accordance with ASTM A 751, *Methods, Practices, and Definitions for Chemical Analysis of Steel Products*. Calibrations performed shall be traceable to established standards.

9.8.2 Tensile Test

9.8.2.1 Test Method

The tensile testing procedure shall conform to the requirements of ASTM A 370, *Methods and Definitions for Mechanical Testing of Steel Products*. All tensile tests, except transverse weld and ring tests, shall include yield strength, ultimate tensile strength, and elongation determinations and shall be performed with the specimens at room temperature. The strain rate shall be in accordance with the requirements of ASTM A 370.

9.8.2.2 Equipment

Tensile test machines shall have been calibrated within 15 months preceding any test in accordance with the procedures of ASTM E 4, *Practices for Load Verification of Testing Machines*. Where yield strength is determined by the use of extensometers, such extensometers shall be calibrated within the preceding 15 months in accordance with the procedures of ASTM E 83, *Method of Verification and Classification of Extensometers*.

9.8.3 Guided-Bend Test

One face-bend and one root-bend specimen, both conforming to Figure 10, shall be bent approximately 180° in a jig substantially in accordance with Figure 11. For any combination of specified outside diameter, specified wall thickness, and grade, the maximum value for jig dimension A in Figure 11 may be calculated using the equation shown. The manufacturer shall use a jig based on this dimension, or a smaller dimension at his option; however, to minimize the number of jigs required, standard values for dimension A have been selected for pipe sizes 12³/₄ and larger. These values are listed for each size, specified wall thickness, and grade in Appendix G. For intermediate grades or specified wall thicknesses, the next smaller standard value for dimension A shall be used. When dimension A is greater than 9 in. (228.6 mm), the length of the specimen required to contact the male die need not exceed 9 in. (228.6 mm). For pipe with wall thickness over 0.750 in. (19.1 mm), a reduced wall specimen as shown in Figure 10 may be used at the option of the manufacturer. Reduced wall specimens shall be tested in a jig with the A dimension calculated for 0.750 in. (19.1 mm) wall pipe of the appropriate size and grade. The specimens (a) shall not fracture completely; (b) shall not reveal any cracks or ruptures in the weld metal greater than 1/8 in. (3.18 mm) in length regardless of depth; and (c) shall not reveal any cracks or ruptures in the parent metal, heat affected zone, or fusion line longer than 1/8 in. (3.18 mm) and deeper than 12¹/₂% of the specified wall thickness; except cracks that occur at the edges of the specimen and are less than 1/4 in. (6.35 mm) long shall not be cause for rejection in (b) or (c) above regardless of depth.

9.8.4 Charpy Test

Charpy tests shall be performed by the manufacturer in accordance with ASTM A370, *Methods and Definitions for Mechanical Testing of Steel Products*.

For purposes of determining conformance with these Charpy V-notch fracture toughness requirements, observed and calculated values shall be rounded to the nearest whole number in accordance with the rounding method of ASTM E 29, *Practice for Using Significant Digits in Test Data to Determine Conformance with Specifications*. Observed values that are rounded will be referred to as individual readings.

When subsize specimens are used, the individual readings and the average of the three readings are divided by the ratio of the specimen width tested to the full-size specimen width and compared with the full-size acceptance criteria.

For acceptance, the average absorbed energy of the three individual specimens from a length shall not be less than the required full-size value. In addition, the individual test value for any specimen shall not be less than three-fourths of the required minimum average absorbed energy value.

9.9 INVALIDATION OF TESTS

9.9.1 Defective Tensile Test Specimens

When the elongation of any tensile test specimen is less than that specified and if any part of the fracture is outside the middle third of the gage length as indicated by scribe scratches marked on the specimen before testing, a retest shall be allowed.

9.9.2 Defective Mechanical Test Specimens

For any of the mechanical tests in Section 6, any test specimen that shows defective preparation or material imperfections unrelated to the intent of the particular mechanical test, whether observed before or after testing, may be discarded and replaced by another specimen from the same length of pipe.

9.10 RETESTS

9.10.1 Recheck Analyses

If the product analyses of both samples representing the heat fail to conform to the specified requirements, at the manufacturer's option either the heat shall be rejected or the remainder of the heat shall be tested individually for conformance to the specified requirements. If the product analysis of only one of the samples representing the heat fails to conform to the specified requirements, at the manufacturer's option either the heat shall be rejected or two recheck analyses shall be made using two additional samples from the heat. If both recheck analyses conform to the specified requirements, the heat shall be accepted, except for the pipe, plate, or skelp from which the initial sample that failed was taken. If one or both recheck analyses fail to conform to the specified

requirements, at the manufacturer's option either the heat shall be rejected or the remainder of the heat shall be tested individually for conformance to the specified requirements.

For such individual testing, analyses for only the rejecting element or elements need be determined.

Samples for recheck analyses shall be taken in the same location as specified for product analysis samples

9.10.2 Retests

If the tensile test specimen representing a lot of pipe fails to conform to the specified requirements, the manufacturer may elect to retest two additional lengths from the same lot. If both retested specimens conform to the specified requirements, all the lengths in a lot shall be accepted, except the length from which the initial specimen was taken. If one or both of the retested specimens fail to conform to the specified requirements, the manufacturer may elect to individually test the remaining lengths in the lot, in which case determinations are required only for the particular requirements with which the specimens failed to comply in the preceding tests. Specimens for retest shall be taken in the same manner as the specimen that failed to meet the minimum requirements.

9.10.3 Flattening Retest

Flattening retest provisions are as follows:

- a. Nonexpanded electric welded pipe in grades higher than A25 and nonexpanded laser welded pipe smaller than $12^{3/4}$, produced in single lengths—The manufacturer may elect to retest any failed end until the requirements are met, providing the finished pipe is not less than 80% of its length after initial cropping.
- b. Nonexpanded electric welded pipe produced in grades higher than A25 and nonexpanded laser-welded pipe smaller than $12^{3/4}$, produced in multiple lengths—The manufacturer may elect to retest each end of each individual length if any test fails. The retests for each end of each individual length shall be made with the weld alternately at 0° and 90° .
- c. Cold-expanded electric welded pipe in grades higher than A25; all welded Grade A25 in sizes $2^{7/8}$ and larger; and cold-expanded laser welded pipe smaller than size $12^{3/4}$ —The manufacturer may elect to retest one end from each of two additional lengths of the same lot. If both retests are acceptable, all lengths in the lot shall be accepted, except the original failed length. If one or both retests fail, the manufacturer may elect to repeat the test on specimens cut from one end of each of the remaining individual lengths in the lot.

9.10.4 Bend Retest

If the specimen fails to conform to the specified requirements, the manufacturer may elect to make retests on specimens cut from two additional lengths from the same lot. If all retest specimens conform to the specified requirements,

all lengths in the lot shall be accepted, except the length from which the initial specimen was taken. If one or more of the retest specimens fail to conform to the specified requirements, the manufacturer may elect to repeat the test on specimens cut from the individual lengths remaining in the lot.

9.10.5 Guided-Bend Retest

If one or both of the guided-bend specimens fail to conform to the specified requirements, the manufacturer may elect to repeat the tests on specimens cut from two additional lengths of pipe from the same lot. If such specimens conform to the specified requirements, all lengths in the lot shall be accepted, except the length initially selected for test. If any of the retested specimens fail to pass the specified requirements, the manufacturer may elect to test specimens cut from the individual lengths remaining in the lot. The manufacturer may also elect to retest any length that has failed to pass the test by cropping back and cutting two additional specimens from the same end. If the requirements of the original test are met by both of these additional tests, that length shall be acceptable. No further cropping and retesting is permitted. Specimens for retests shall be taken in the same manner as specified in 9.8.3.

9.10.6 Weld Ductility Retest

If the weld ductility test specimen representing a lot of pipe fails to conform to the requirements of 6.2.5, the manufacturer may elect to retest two additional lengths from the same lot. If both retested specimens conform to the specified requirements, all the lengths in the lot shall be accepted, except the length from which the initial specimen was taken. If one or both of the retested specimens fail to conform to the specified requirements, the manufacturer may elect to test specimens cut from one end of the individual lengths remaining in the lot. Precaution shall be taken so that the specimens can be identified with the length of pipe from which they were cut. The manufacturer may also elect to retest any length that has failed to pass the above test procedure by cropping back and cutting two additional specimens from the same end. If the weld ductility test requirements are met by both of these additional tests, that length shall be acceptable. No further cropping and retesting is permitted.

9.10.7 Charpy Retests

In the event that a set of Charpy test specimens fails to meet the acceptance criteria, the manufacturer may elect to replace the lot of material involved or alternatively to test two more lengths from that lot. If both of the new tests meet the acceptance criteria, then all pipe in that heat, with the exception of the original selected length, shall be considered to meet the

requirement. Failure of either of the two additional tests shall require testing of each length in the lot for acceptance.

9.11 REPROCESSING

If any mechanical property test result for a lot of pipe, as defined in 9.3, fails to conform to the applicable requirements, the manufacturer may elect to heat treat the lot of pipe in accordance with the requirements of 5.4, consider it a new lot, test it in accordance with all requirements of 6.2 and 9.3, SR5, and SR6 that are applicable to the order item, and proceed in accordance with the applicable requirements of this specification. After one reprocessing heat treatment, any additional reprocessing heat treatment shall be subject to agreement with the purchaser.

For non-heat treated pipe, any reprocessing heat treatment shall be subject to agreement with the purchaser. For heat treated pipe, any reprocessing with a different type of heat treatment (see 5.4) shall be subject to agreement with the purchaser.

10 Marking

10.1 GENERAL

Pipe and pipe couplings manufactured in conformance with this specification shall be marked by the manufacturer as specified herein (see note).

Note: Users of this specification should note that there is no longer a requirement for marking a product with the API monogram. API continues to license use of the monogram on products covered by this specification, but it is administered by the staff of the Institute separately from the specification. The policy describing use of the monogram is contained in Appendix I. No other use of the monogram is permitted. Licensees mark products in conformance with Section 10 or Appendix I and nonlicensees mark products in conformance with Section 10.

10.1.1 The required marking on pipe shall be as specified hereinafter.

10.1.2 The required marking on couplings shall be die stamped unless otherwise agreed between the purchaser and the manufacturer, in which case it shall be paint stenciled.

10.1.3 Additional markings including those for compatible standards following the specification marking are allowed and may be applied as desired by the manufacturer or as requested by the purchaser.

10.2 LOCATION OF MARKINGS

The location of identification markings shall be as follows:

- a. Size 1.900 or smaller—Die stamped on a metal tag fixed to the bundle or may be printed on the straps or banding clips used to tie the bundle.
- b. Seamless pipe in all other sizes and welded pipe smaller than size 16—Paint stencil on the outside surface starting at a point between 18 in. and 30 in. (457.2 mm and 762 mm) from

the end of the pipe in the sequence shown in 10.3, except when agreed between the purchaser and the manufacturer some or all of the markings may be placed on the inside surface in a sequence convenient to the manufacturer.

c. Welded pipe size 16 and larger—Paint stencil on the inside surface starting at a point no less than 6 in. (152.4 mm) from the end of the pipe in a sequence convenient to the manufacturer, unless otherwise specified by the purchaser.

10.3 SEQUENCE OF MARKINGS

The sequence of identification markings shall be as specified in 10.3.1 through 10.3.10.

10.3.1 Manufacturer

Manufacturer's name or mark shall be the first identifying mark.

10.3.2 Specification

"Spec 5L" shall be marked when the product is in complete compliance with this specification.

10.3.3 Compatible Standards

Products in compliance with multiple compatible standards may be marked with the name of each standard.

10.3.4 Specified Dimensions

The specified outside diameter and the specified wall thickness shall be marked, except that, for the specified outside diameter, any ending zero digits to the right of the decimal need not be included in such markings.

10.3.5 Grade and Class

The symbols to be used are as follows:

Grade (see Note)	Symbol
A25, Class I	A25
A25, Class II	A25R
A	A
B	B
X42	X42
X46	X46
X52	X52
X56	X56
X60	X60
X65	X65
X70	X70
X80	X80

For grades intermediate to X42 and X80, the symbol shall be X followed by the first two digits of the specified minimum yield strength in U.S. Customary units.

By agreement between the purchaser and the manufacturer and when so specified on the purchase order, the grade shall be identified by color in accordance with SR3 (see Appendix F).

Note: See 1.3 for limitations on downgrading.

10.3.6 Product Specification Level

The symbols to be used are as follows:

- | | |
|----------|------|
| a. PSL 1 | PSL1 |
| b. PSL 2 | PSL2 |

The PSL marking shall be placed immediately after the grade symbol.

10.3.7 Process of Manufacture

The symbols to be used are as follows:

- | | |
|---|---|
| a. Seamless pipe | S |
| b. Welded pipe, except continuous welded and laser welded | E |
| c. Continuous welded pipe | F |
| d. Laser welded pipe | L |

10.3.8 Heat Treatment

The symbols to be used are as follows:

- | | |
|--|----|
| a. Normalized or normalized and tempered | HN |
| b. Subcritical stress relieved | HS |
| c. Subcritical age hardened | HA |
| d. Quench and tempered | HQ |

10.3.9 Test Pressure

When the specified hydrostatic test pressure is higher than the tabulated pressure (Tables 4, 5, 6A, 6B, 6C, E-6A, E-6B, or E-6C, whichever is applicable), the word "TESTED" shall be marked, immediately followed by the specified test pressure (in pounds per square inch for pipe ordered in U.S. Customary units, or in hundreds of kilopascals for pipe ordered in SI units).

10.3.10 Supplementary Requirements

See Appendix F for supplementary requirements.

10.3.11 Examples

- a. Size 14, 0.375 in. (9.5 mm) specified wall thickness, Grade B, PSL 2, seamless, plain-end pipe should be paint stenciled as follows, using the values that are appropriate for the pipe dimensions specified on the purchase order:

AB CO Spec 5L 14 0.375 B PSL2 S
or
AB CO Spec 5L 355.6 9.5 B PSL2 S

- b. Size $6\frac{5}{8}$, 0.280 in. (7.1 mm) specified wall thickness, Grade B, PSL 1, electric welded, plain-end pipe should be paint stenciled as follows, using the values that are appropriate for the pipe dimensions specified on the purchase order:

AB CO Spec 5L 6.625 0.280 B PSL1 E
or
AB CO Spec 5L 168.3 7.1 B PSL1 E

- c. Size $4\frac{1}{2}$, 0.237 in. (6.0 mm) specified wall thickness, Grade A25, Class I, continuous welded, threaded-end pipe should be paint stenciled as follows, using the values that are appropriate for the pipe dimensions specified on the purchase order:

AB CO Spec 5L 4.5 0.237 A25 PSL1 F
or
AB CO Spec 5L 114.3 6.0 A25 PSL1 F

- d. Size 14, 0.375 in. (9.5 mm) specified wall thickness, Grade X70, PSL 2, seamless, quenched and tempered, plain-end pipe should be paint stenciled as follows, using the values that are appropriate for the pipe dimensions specified on the purchase order:

AB CO Spec 5L 14 0.375 X70 PSL2 S HQ
or
AB CO Spec 5L 355.6 9.5 X70 PSL2 S HQ

- e. Size $12\frac{3}{4}$, 0.330 in. (8.4 mm) specified wall thickness, Grade X42, PSL 1, seamless plain-end pipe should be paint stenciled as follows, using the values that are appropriate for the pipe dimensions specified on the purchase order:

AB CO Spec 5L 12.75 0.330 X42 PSL1 S
or
AB CO Spec 5L 323.9 8.4 X42 PSL1 S

- f. Size $6\frac{5}{8}$, 0.216 in. (5.5 mm) specified wall thickness, Grade X42, PSL 1, laser welded, plain-end pipe should be paint stenciled as follows, using the values that are appropriate for the pipe dimensions specified on the purchase order:

AB CO Spec 5L 6.625 0.216 X42 PSL1 L
or
AB CO Spec 5L 168.3 5.5 X42 PSL1 L

- g. Size 24, 0.406 in. (10.3 mm) specified wall thickness, Grade X42, PSL 2 helical seam submerged-arc welded plain-end pipe should be paint stenciled as follows, using the values that are appropriate for the pipe dimensions specified on the purchase order:

AB CO Spec 5L 24 0.406 X42 PSL2 E
or
AB CO Spec 5L 610 10.3 X42 PSL2 E

10.4 BUNDLE IDENTIFICATION

For pipe of size 1.900 or smaller, the identification markings specified in 10.3 shall be placed on the tag, strap, or clip used to tie the bundle. For example, size 1.900, 0.145 in. (3.7 mm) specified wall thickness, Grade B, electric welded, plain-end pipe should have the following marking, using the values that are appropriate for the pipe dimensions specified on the purchase order:

AB CO Spec 5L 1.9 0.145 B PSL1 E

or

AB CO Spec 5L 48.3 3.7 B PSL1 E

10.5 LENGTH

In addition to the identification markings stipulated in 10.2, 10.3, and 10.4, the length shall be marked as follows, using feet and tenths of a foot for pipe ordered in U.S. Customary units, or meters to two decimal places for pipe ordered in SI units, unless a different measuring and marking format has been agreed upon by the purchaser and the manufacturer:

- a. For pipe larger than size 1.900, the length, as measured on the finished pipe, shall be paint stenciled on the outside surface at a location convenient to the manufacturer, or by agreement between the purchaser and the manufacturer, on the inside surface at a convenient location.
- b. For pipe of size 1.900 or smaller, the total length of pipe in the bundle shall be marked on the tag, band, or clip.

10.6 COUPLINGS

All couplings in sizes $2\frac{3}{8}$ and larger shall be identified with the manufacturer's name or mark and "Spec 5L".

10.7 DIE STAMPING

Cold die stamping is prohibited on all pipe with specified wall thickness of 0.156 in. (4.0 mm) or less and all pipe of grades higher than A25 and not subsequently heat treated, except by agreement between the purchaser and the manufacturer and when so specified on the purchase order, pipe or plate may be cold die stamped. The manufacturer at his option may hot die stamp [200°F (93°C) or higher] plate or pipe, cold die stamp plate or pipe if it is subsequently heat treated, and cold die stamp couplings. Cold die stamping shall be done with rounded or blunt dies. All die stamping shall be at least 1 in. (25.4 mm) from the weld for all grades except Grade A25.

10.8 THREAD IDENTIFICATION

At the manufacturer's option, threaded-end pipe may be identified by stamping or stenciling the pipe adjacent to the threaded ends, with the manufacturer's name or mark, "Spec 5B" (to indicate the applicable threading specification), the specified outside diameter of the pipe, and the letters "LP" (to indicate the type of thread). The thread marking may be applied to products that do or do not bear the API monogram.

For example, size $6\frac{5}{8}$ threaded-end pipe may be marked as follows, using the value that is appropriate for the pipe outside diameter specified on the purchase order:

AB CO Spec 5B 6.625 LP

or

AB CO Spec 5B 168.3 LP

If the product is clearly marked elsewhere with the manufacturer's identification, his name or mark, as above, may be omitted.

10.9 THREAD CERTIFICATION

The use of the letters "Spec 5B" as provided in 10.8 shall constitute a certification by the manufacturer that the threads so marked comply with the requirements in API Standard 5B but should not be construed by the purchaser as a representation that the product so marked is, in its entirety, in accordance with any API specification. Manufacturers who use the letters "Spec 5B" for thread identification are required to have access to properly certified API master pipe gages.

10.10 PIPE PROCESSOR MARKINGS

Pipe heat treated by a processor other than the original pipe manufacturer shall be marked as stipulated in 10.1, 10.2, 10.3, 10.4, 10.5, 10.6, and 10.7. The processor shall remove any marking that does not indicate the new condition of the product as a result of heat treating (such as prior grade identity and original pipe manufacturer's name or logo).

11 Coating and Protection

11.1 COATINGS

Unless otherwise specified in the purchase order, pipe shall be supplied either uncoated (bare) or with a temporary external coating to minimize rusting in transit, at the option of the manufacturer. Temporary coatings should be hard to the touch and smooth, with minimum sags.

If the purchaser requires pipe to be uncoated, or to have a temporary or special coating, the purchase order should so state.

For special coatings, the purchase order should state whether the coating is to be applied full length, or with a specified cutback (uncoated distance at each pipe end). Unless otherwise specified, the manufacturer has the option to leave the pipe ends either coated or uncoated, and the option to apply a temporary coating to the pipe ends.

11.2 THREAD PROTECTORS

On pipe smaller than size $2\frac{3}{8}$, the thread protectors shall be suitable fabric wrappings or suitable metal, fiber, or plastic protectors. On pipe of sizes $2\frac{3}{8}$ and larger, the thread protectors shall be of such design, material, and mechanical strength to protect the thread and end of the pipe from damage under normal handling and transportation conditions. The thread protectors shall cover the full length of the thread on the pipe and

exclude water and dirt from the thread during transportation and the period of normal storage. The normal storage period shall be considered approximately one year. The thread forms in protectors shall be such that the pipe threads are not damaged by the protectors. Protector material shall contain no compounds capable of causing corrosion or promoting adherence of the protectors to the threads and shall be suitable for service temperatures of -50°F to $+150^{\circ}\text{F}$ (-46°C to $+66^{\circ}\text{C}$).

12 Documents

12.1 CERTIFICATION

12.1.1 PSL 1 Certification Requirements

The manufacturer shall, upon request by the purchaser, furnish to the purchaser a certificate of compliance stating that the material has been manufactured, sampled, tested, and inspected in accordance with this specification and has been found to meet the requirements.

A Material Test Report, Certificate of Compliance or similar document printed from or used in electronic form from an electronic data interchange (EDI) transmission shall be regarded as having the same validity as a counterpart printed in the certifier's facility. The content of the EDI transmitted document must meet the requirements of this specification and conform to any existing EDI agreement between the purchaser and supplier.

Where additional information is required, including the results of mechanical testing, SR15 shall be specified on the purchase order (see Appendix F).

12.1.2 PSL 2 Certification Requirements

The manufacturer shall provide to the purchaser certificates of compliance and test results in compliance with SR15.1 (see Appendix F).

12.2 RETENTION OF RECORDS

Tests and inspections requiring retention of records in this specification are shown in Table 22. Such records shall be retained by the manufacturer and shall be made available to the purchaser upon request for a 3-year period after the date of purchase from the manufacturer.

13 Pipe Loading

When the manufacturer is responsible for the shipment of pipe, the manufacturer shall prepare and follow loading diagrams which detail how the pipe is arranged, protected, and secured on trucks, railcars, barges or oceangoing vessels, as applicable. The loading shall be designed to prevent end damage, abrasion, peening, and fatigue cracking. The loading shall comply with any rules, codes, standards, or recommended practices which are applicable. Examples of these may include but are not limited to:

American Association of Railroads—*General Rules Governing the Loading of Commodities on Open Top Cars*

American Association of American Railroads—*Rules Governing the Loading of Steel Products Including Pipe on Open Top Cars*

API RP 5L1—*Recommended Practice for Railroad Transportation of Line Pipe*

API RP 5LW—*Recommended Practice for Transportation of Line Pipe on Barges and Marine Vessels*

Figure 5—Flattening Tests

Notes:

1. The diameter of each hole shall be 1/16 in. (1.6 mm).
2. Holes shall be round and drilled perpendicular to the surface.
3. Holes shall be free of burrs, but edges shall not be chamfered.
4. Each penetrometer shall carry a lead identification number as given in Tables 14 and 15.

Footnotes to Tables 2A and 2B:

^aFor each reduction of 0.01% below the specified maximum carbon content, an increase of 0.05% above the specified maximum manganese content is permissible, up to a maximum of 1.50% for Grades X42 through X52, up to a maximum of 1.65% for grades higher than X52 but less than X70, and up to 2.00% for Grades X70 and higher.

^bColumbium [niobium], vanadium, titanium, or combinations thereof may be used by agreement between the purchaser and manufacturer.

^cColumbium [niobium], vanadium, titanium, or combinations thereof may be used at the discretion of the manufacturer.

^dThe sum of the columbium [niobium], vanadium, and titanium contents shall not exceed 0.15%.

^eOther chemical compositions may be furnished by agreement between purchaser and manufacturer, providing that the limits of Footnote d, and the tabular limits for phosphorus and sulfur are met.

Footnotes to Tables 3A and 3B:

^aThe minimum elongation in 2 in. (50.8 mm) shall be that determined by the following equation:

U.S. Customary Unit Equation

$$e = 625,000 \frac{A^{0.2}}{U^{0.9}}$$

SI Unit Equation

$$e = 1,944 \frac{A^{0.2}}{U^{0.9}}$$

where

 e = minimum elongation in 2 in. (50.8 mm) in percent rounded to the nearest percent. A = applicable tensile test specimen area, as follows:a. For both sizes of round bar specimens, 0.20 in.² (130 mm²);b. For full section specimens, the smaller of (i) 0.75 in.² (485 mm²) and (ii) the cross-sectional area of the test specimen, calculated using the specified outside diameter of the pipe and the specified wall thickness of the pipe, rounded to the nearest 0.01 in.² (10 mm²); andc. For strip specimens, the smaller of (i) 0.75 in.² (485 mm²) and (ii) the cross-sectional area of the test specimen, calculated using the specified width of the test specimen and the specified wall thickness of the pipe, rounded to the nearest 0.01 in.² (10 mm²). U = specified minimum ultimate tensile strength in psi (MPa).

See Appendix D for the specified minimum elongation values for various tensile specimen sizes and grades.

^bMaximum yield strength for an intermediate grade shall be the maximum for the next higher listed grade.^cAll intermediate grades have a maximum ultimate tensile strength of 110,000 psi (758 MPa).^dMaximum yield strength for Grade B pipe in sizes subject to longitudinal testing is 72,000 psi (496 MPa).^eFor wall thickness greater than 0.984 inch (25.0 mm), the maximum yield strength shall be determined by agreement between the purchaser and the manufacturer.

					Alt.	—	2800	2800	7260	7260	7260	7260	7260	7260	7260

Note: See Table E-6B for SI unit values corresponding to the U.S. Customary unit values given in this table.

^aThe calculated inside diameters are given here for information (see 7.2).

^bThe test pressures given in Tables 6A, 6B, and 6C apply to Grades A25, A, B, X42, X46, X52, X56, X60, X65, X70, and X80 only. See 9.4.3 for pressures applicable to other grades.

^cPipe that has this combination of specified outside diameter and specified wall thickness is special plain-end pipe; other combinations given in this table are regular plain-end pipe. Pipe that has a combination of specified outside diameter and specified wall thickness that is intermediate to the tabulated values is considered to be special plain-end pipe if the next lower tabulated value is for special plain-end pipe; other intermediate combinations are considered to be regular plain-end pipe. (See Table 10 for the applicable weight tolerances.)

					Alt.	700	820	1180	1290	1460	1580	1690	1830	1970

Note: See Table E-6C for SI unit values corresponding to the U.S. Customary unit values given in this table.

^aThe calculated inside diameters are given here for information (see 7.2).

^bThe test pressures given in Tables 6A, 6B, and 6C apply to Grades A25, A, B, X42, X46, X52, X56, X60, X65, X70, and X80 only. See 9.4.3 for pressures applicable to other grades.

^cPipe that has this combination of specified outside diameter and specified wall thickness is special plain-end pipe; other combinations given in this table are regular plain-end pipe. Pipe that has a combination of specified outside diameter and specified wall thickness that is intermediate to the tabulated values is considered to be special plain-end pipe if the next lower tabulated value is for special plain-end pipe; other intermediate combinations are considered to be regular plain-end pipe. (See Table 10 for the applicable weight tolerances.)

Table 7—Tolerances for Diameter of Pipe Body

Size	Tolerance ^a (with respect to specified outside diameter)
$< 2\frac{3}{8}$	+ 0.016 in., – 0.031 in. (+ 0.41 mm, – 0.79 mm)
$\geq 2\frac{3}{8}$ and $\leq 4\frac{1}{2}$, continuous welded	$\pm 1.00\%$
$\geq 2\frac{3}{8}$ and < 20	$\pm 0.75\%$
≥ 20 , seamless	$\pm 1.00\%$
≥ 20 and ≤ 36 , welded	+ 0.75%, – 0.25%
> 36 , welded	+ $\frac{1}{4}$ in., – $\frac{1}{8}$ in. (+ 6.35 mm, – 3.20 mm)

^aIn the case of pipe hydrostatically tested to pressures in excess of standard test pressures, other tolerances may be agreed upon between the manufacturer and the purchaser.

Table 8—Tolerance for Diameter at Pipe Ends

Size	Minus Tolerance	Plus Tolerance	End-to-End Tolerance	Out-of-Roundness	
				Diameter, Axis Tolerance (Percent of Specified OD) ^a	Maximum Differential Between Minimum and Maximum Diameters (Applies Only to Pipe With $D/t \leq 75$)
$\leq 10\frac{3}{4}$	$\frac{1}{64}$ (0.40 mm)	$\frac{1}{16}$ (1.59 mm)	—	—	—
$> 10\frac{3}{4}$ and ≤ 20	$\frac{1}{32}$ (0.79 mm)	$\frac{3}{32}$ (2.38 mm)	—	—	—
> 20 and ≤ 42	$\frac{1}{32}$ (0.79 mm)	$\frac{3}{32}$ (2.38 mm)	b	$\pm 1\%$	≤ 0.500 in. (12.7 mm)
> 42	$\frac{1}{32}$ (0.79 mm)	$\frac{3}{32}$ (2.38 mm)	b	$\pm 1\%$	≤ 0.625 in. (15.9 mm)

^aOut-of-roundness tolerances apply to maximum and minimum diameters as measured with a bar gage, caliper, or device measuring actual maximum and minimum diameters.

^bThe average diameter (as measured with a diameter tape) of one end of pipe shall not differ by more than $\frac{3}{32}$ in. (2.38 mm) from that of the other end.

Table 9—Tolerances for Wall Thickness

Size	Type of Pipe	Tolerance ^a (Percent of Specified Wall Thickness)	
		Grade B or Lower	Grade X42 or Higher
$\leq 2\frac{7}{8}$	All	+ 20.0, – 12.5	+ 15.0, – 12.5
$> 2\frac{7}{8}$ and < 20	All	+ 15.0, – 12.5	+ 15.0, – 12.5
≥ 20	Welded	+ 17.5, – 12.5	+ 19.5, – 8.0
≥ 20	Seamless	+ 15.0, – 12.5	+ 17.5, – 10.0

^aWhere negative tolerances smaller than those listed are specified by the purchaser, the positive tolerance shall be increased to the applicable total tolerance range in percent less the wall thickness negative tolerance.

Table 10—Tolerances for Weight

Quantity	Tolerance (percent)
Single lengths, special plain-end pipe or A25 pipe	+ 10, – 5.0
Single lengths, other pipe	+ 10, – 3.5
Carloads, Grade A25, 40,000 lb (18 144 kg) or more	– 2.5
Carloads, other than Grade A25, 40,000 lb (18 144 kg) or more	– 1.75
Carloads, all grades, less than 40,000 lb (18 144 kg)	– 3.5
Order items, Grade A25, 40,000 lb (18 144 kg) or more	– 3.5
Order items, other than Grade A25, 40,000 lb (18 144 kg) or more	– 1.75
Order items, all grades, less than 40,000 lb (18 144 kg)	– 3.5

Notes:

1. Weight tolerances apply to the calculated weights for threaded-and-coupled pipe and to the tabulated or calculated weights for plain-end pipe. Where negative wall thickness tolerances smaller than those listed in Table 9 are specified by the purchaser, the plus weight tolerance for single lengths shall be increased to 22.5 percent less the wall thickness negative tolerance.
2. For carloads composed of pipe from more than one order item, the carload tolerances are to be applied on an individual order item basis.
3. The tolerances for order items apply to the overall quantity of pipe shipped for the order item.

Table 11—Tolerances on Lengths

Nominal Length ^a		Minimum Length		Minimum Average Length for Each Order Item ^b		Maximum Length	
ft	m	ft	m	ft	m	ft	m
Threaded-and-Coupled Pipe							
20	6	16.0	4.88	17.5	5.33	22.5	6.86
40	12	22.0	6.71	35.0	10.67	45.0	13.72
Plain-End Pipe							
20	6	9.0	2.74	17.5	5.33	22.5	6.86
40	12	14.0	4.27	35.0	10.67	45.0	13.72
50	15	17.5	5.33	43.8	13.35	55.0	16.76
60	18	21.0	6.40	52.5	16.00	65.0	19.81
80	24	28.0	8.53	70.0	21.34	85.0	25.91

^aNominal lengths of 20 ft (6 m) were formerly designated “single random lengths” and those of 40 ft (12 m) “double random lengths.”

^bBy agreement between the purchaser and the manufacturer, these tolerances shall apply to each carload.

Table 12— Coupling Dimensions, Weights, and Tolerances

(1)	(2)		(3)		(4)		(5)		(6)

^aTolerance on outside diameter, *W*, is $\pm 1\%$.

Table 13—Maximum Inspection Lot Size for Tensile Testing

(1)	(2)	(3)	(4)
Size	Tensile Tests	Weld Tensile Tests	Control Tensile Tests
≤ 1.900, A25 Welded	25 tons (22.7 Mg)	—	—
> 1.900, A25 Welded	50 tons (45.5 Mg)	—	—
≤ 5 ⁹ / ₁₆ , except A25 Welded	400 lengths	—	Heat of steel
> 5 ⁹ / ₁₆ and < 8 ⁵ / ₈	200 lengths ^a	—	Heat of steel
≥ 8 ⁵ / ₈ through 12 ³ / ₄	200 lengths ^a	200 lengths	Heat of steel
> 12 ³ / ₄	100 lengths ^a per cold expansion amount ^b	100 lengths ^c per cold expansion amount ^b	Heat of steel

^aAn inspection lot shall consist of pipe that is made to the same size and the same specified wall thickness by the same process and under the same manufacturing conditions. For pipe of grades higher than A25 in sizes greater than 5⁹/₁₆, an inspection lot shall not contain more than one heat of steel.

^bPipe manufactured with the same nominal amount of cold expansion, ± 0.2%, shall be considered to have the same cold expansion amount.

^cEach weld for two-seam pipe.

Note: The test frequency is one test per inspection lot. (See 9.3.1.2.)

Table 14—Relationship Between Pipe Dimensions and Required Charpy Specimens

Size	Minimum Wall Thickness, in. (mm)				
	Full Size Transverse	² / ₃ Size Transverse	¹ / ₂ Size Transverse	² / ₃ Size Longitudinal	¹ / ₂ Size Longitudinal

Notes:

1. This table provides a description of the required specimens and the relationship between pipe dimensions and acceptable specimens. The size limits for transverse specimens shown are based upon the use of nonflattened, tapered end, test specimens.
2. All specimen dimension limits include machining tolerances.
3. Pipe in size and wall thickness combinations not covered by this table are not required to be tested.

APPENDIX A—SPECIFICATION FOR WELDED JOINTERS (NORMATIVE)

A.1 Method

Welding of any type that uses deposited filler metal and is generally recognized as sound practice shall be permitted unless the purchaser specifies a particular method. Welding procedures, welders, and welding machine operators (hereafter called operators) shall be qualified in accordance with API Standard 1104. Copies of the welding procedure specification and procedure qualification record shall be provided to the purchaser upon request.

A.2 Workmanship

The ends of the pipe to be welded together shall be prepared in accordance with the requirements of the procedure to be used. Pipe weld seams (straight, helical, or skelp end) shall be staggered between 2 in. and 8 in. (51 mm and 203 mm) unless otherwise specified by the purchaser. The completed jointers shall be straight within the limits of 7.6 of this specification. Each weld shall have a substantially uniform cross section

around the entire circumference of the pipe. At no point shall its crowned surface be below the outside surface of the parent metal nor shall it rise above the parent metal by more than $\frac{1}{8}$ in. (3.18 mm) if submerged-arc welded, or by more than $\frac{1}{16}$ in. (1.59 mm), if welded by another process.

A.3 Marking

Each jointer shall be marked using paint to identify the welder or operator.

A.4 Nondestructive Testing

The girth welds of jointers shall be 100% radiographed in accordance with the procedures and standards of acceptability in API Standard 1104 (see note). Jointer welds failing to pass this radiographic testing may be repaired and re-radiographed in accordance with the procedures and acceptance criteria of API Standard 1104.

Note: See 7.7 for length requirements on jointers.

APPENDIX B—REPAIR OF DEFECTS BY WELDING (NORMATIVE)

B.1 Types Of Pipe

B.1.1 SEAMLESS PIPE AND PARENT METAL OF WELDED PIPE

For PSL 1 pipe, the repair of defects in seamless pipe and parent metal of welded pipe is permissible except (a) when the depth of the defect exceeds $33\frac{1}{3}\%$ of the specified wall thickness of the pipe and the length of that portion of the defect in which the depth exceeds $12\frac{1}{2}\%$ is greater than 25% of the specified outside diameter of the pipe; or (b) when more than one repair is required in any length equivalent to 10 times the specified outside diameter of the pipe. Repairs shall be made in accordance with B.2. Repair welds shall be inspected by the magnetic particle method in accordance with 9.7.5.1 through 9.7.5.3; by liquid penetrant; or by other NDT methods as agreed start between purchaser and the manufacturer.

For PSL 2, seamless pipe, the parent metal (body) of welded pipe, plate, and skelp shall not be repaired by welding.

B.1.2 WELD SEAM OF WELDED PIPE

B.1.2.1 Defects in filler metal welds may be repaired at the option of the manufacturer; such repairs shall be in accordance with B.3. All repair welds shall be inspected by ultrasonic methods in accordance with 9.7.4.1 through 9.7.4.3, except that the equipment need not be capable of continuous and uninterrupted operation and, at the option of the manufacturer, repairs made by submerged-arc welding or by shielded metal-arc welding may alternatively be inspected by radiological methods in 9.7.3.

B.1.2.2 For PSL 1 pipe, weld seams made without filler metal (electric and laser welds) may be repaired by welding only by agreement between the purchaser and the manufacturer; such repairs shall be in accordance with B.4.

B.1.2.3 For PSL 2 pipe, weld seams made without filler metal shall not be repaired by welding.

B.1.3 HEAT TREATED PIPE

When heat treated pipe has been repaired by welding, the need for and type of reheat treatment shall be based on the effect of the repair on the structure and properties of the heat treated pipe, by agreement between the purchaser and the manufacturer.

B.2 Procedure for Repair by Welding of Seamless Pipe and Parent Metal of Welded Pipe (PSL 1 Only)

The repair of defects in seamless pipe and parent metal of welded pipe shall conform to the requirements listed in

B.2.1–B.2.5. Conformance to the repair procedure is subject to approval of the purchaser's inspector.

B.2.1 The defect shall be removed completely by chipping and/or grinding. The resulting cavity shall be thoroughly cleaned and shall be inspected before welding by magnetic particle methods in accordance with 9.7.5 to ensure complete removal of the defect.

B.2.2 The minimum length of repair weld shall be 2 in. (50.8 mm). Where the orientation of the defect permits, the repair weld shall be placed in the circumferential direction.

B.2.3 The repair weld shall be made either by automatic submerged-arc welding, gas metal-arc welding, or manual shielded metal-arc welding using low-hydrogen electrodes. The metal temperature in the area to be repaired shall be a minimum of 50°F (10°C). The welding procedure and performance shall be qualified in accordance with Appendix C.

B.2.4 The repair weld shall be ground to merge smoothly into the original contour of the pipe.

B.2.5 Repaired pipe shall be tested hydrostatically after repairing, in accordance with 9.4.

B.3 Procedure for Repair of Submerged-Arc and Gas Metal-Arc Welds

The repair of submerged-arc and gas metal-arc welds shall conform to the requirements listed in B.3.1–B.3.3. Conformance is subject to approval of purchaser's inspector.

B.3.1 The defect shall be completely removed and the cavity thoroughly cleaned. Where multiple pass repairs are used, the size of the cavity shall be sufficiently large [at least 2 in. (50.8 mm) in length] to avoid coincidence of starts and stops of individual passes.

B.3.2 The minimum length of each repair weld shall be 2 in. (50.8 mm). The repair weld shall be made either by automatic submerged-arc welding, gas metal-arc welding, or manual shielded metal-arc welding using low-hydrogen electrodes. The welding procedure and performance shall be qualified in accordance with Appendix C.

B.3.3 Each length of repaired pipe shall be tested hydrostatically in accordance with 9.4.

B.4 Procedure for Repair of Electric and Laser Welds (PSL 1 Only)

The repair of electric and laser welds shall conform to the requirements in B.4.1 through B.4.6 and shall include the weld zone, which is defined for the purposes of repair as $\frac{1}{2}$ in. (12.7 mm) on each side of the fusion line.

Conformance to the repair procedure is subject to approval of the purchaser's inspector.

B.4.1 The weld zone defect shall be removed completely by chipping and/or grinding, and the resulting cavity shall be thoroughly cleaned.

B.4.2 The minimum length of repair weld shall be 2 in. (50.8 mm), and individual weld repairs shall be separated by at least 10 ft (3 m).

B.4.3 The repair weld shall be made by either automatic submerged-arc welding, gas metal-arc welding, or manual shielded metal-arc welding using low-hydrogen electrodes. The metal temperature in the area to be repaired shall be a

minimum of 50°F (10°C). The welding procedure and performance shall be qualified in accordance with Appendix C.

B.4.4 When a repair weld is made through the full wall thickness, it shall include weld passes made from both the ID and the OD of the pipe. Starts and stops of the ID and OD repair welds shall not coincide.

B.4.5 The repair shall be ground to merge smoothly into the original contour of the pipe and shall have a maximum crown of 0.06 in. (1.52 mm).

B.4.6 Repaired pipe shall be hydrostatically tested after repair in accordance with 9.4.

APPENDIX C—REPAIR WELDING PROCEDURE (NORMATIVE)

C.1 General

All repair welds shall be made in the flat position according to a qualified procedure and by a welding machine operator (hereafter called operator) or repair welder who is qualified in a flat position as specified in C.2. Repair welds may be made by one of the following methods:

- Automatic submerged arc.
- Automatic or semi-automatic gas metal arc.
- Manual shielded metal arc using low-hydrogen electrodes.

All welding materials shall be properly handled and stored in accordance with the manufacturer's recommendations so as to preclude moisture or other contamination. Test welds may be made on either plate stock or pipe stock at the option of the manufacturer.

The manufacturer shall maintain a record of the welding procedure and procedure qualification test results. Copies of the welding procedure specification and procedure qualification record shall be provided to the purchaser upon request.

C.2 Repair Welding Procedure Qualification

Welding procedures shall be qualified by preparing and testing welds in accordance with this appendix. At the option of the manufacturer, the tests specified in the *ASME Boiler and Pressure Vessel Code*, Section IX, may be substituted herein. For the purpose of this appendix, the term automatic welding includes both machine welding and automatic welding as defined in the *ASME Boiler and Pressure Vessel Code*, Section IX.

C.2.1 ESSENTIAL VARIABLES

An existing procedure shall not be applicable and new procedure shall be qualified when any of the following essential variables is changed beyond the stated limits:

- Welding process:
 - A change in the welding process, such as submerged arc to gas metal arc.
 - A change in the method, such as manual to semi-automatic.
- Pipe material:
 - A change in grade category. When different alloying systems are used within one grade category, each alloying composition shall be separately qualified. Grade categories are as follows:
 - ≤ X42
 - > X42 and < X65
 - each grade ≥ X65
 - Within each grade category, a thicker material than the material qualified.

- Within the grade category and thickness range, a carbon equivalent, CE (see note), based on product analysis for the material to be repaired, that is more than 0.04% greater than the CE of the material qualified.

Note:

$$CE = C + \frac{Mn}{6} + \frac{Cr + Mo + V}{5} + \frac{Ni + Cu}{15}$$

- Welding materials:
 - A change in filler metal classification.
 - A change in electrode diameter.
 - A change of more than 5% in the composition of shielding gas.
 - A change of more than 10% in the flow rate of shielding gas.
 - A change in submerged-arc welding flux from one designation to another.
- Welding parameters:
 - A change in the type of current (such as AC versus DC).
 - A change in polarity.
 - For automatic and semi-automatic welding, schedules of welding current, voltage, and speed may be established to cover ranges of wall thicknesses. Within the schedule, appropriately selected points shall be tested to qualify the entire schedule. Thereafter, a new qualification is required if there is a deviation from the qualified schedule greater than the following:
 - 10% in amperage
 - 7% in voltage
 - 10% in travel speed for automatic welding
- Weld bead: For manual and semi-automatic welding, a change in bead width greater than 50%.
- Preheat and post-weld heat treatment:
 - Repair welding at a pipe temperature lower than the pipe temperature of the qualification test.
 - The addition or deletion of post-weld heat treatment.

C.2.2 MECHANICAL TESTING

C.2.2.1 Number of Tests

Two specimens of each type are required from each procedure qualification test.

C.2.2.2 Transverse Tensile Test

The transverse tensile test specimens shall be approximately 1.5 in. (38.1 mm) wide and shall have the transverse butt weld perpendicular to the longitudinal axis at the center of the test specimen (See Figure C-1 or Figure 4.) The weld reinforcement shall be removed from both faces. The ultimate

tensile strength shall be at least equal to the minimum specified for the pipe grade.

C.2.2.3 Transverse Guided-Bend Test

The transverse guided-bend test specimens shall conform to Figure C-2. The weld shall be made in a groove as shown. Each specimen shall be placed on the die with the weld at mid-span and shall be bent approximately 180° in a jig in accordance with Figure C-3 and Table C-1, with the exposed surface of the weld in tension. The bend test shall be considered acceptable if no crack or other defect exceeding $\frac{1}{8}$ in. (3.18 mm) in any direction is present in the weld metal or base metal after bending. Cracks that both originate along the edges of the specimen during testing and measure less than $\frac{1}{4}$ in. (6.35 mm) in all directions shall not be considered.

C.2.2.4 Nick-Break Test

The nick-break specimens shall conform to Figure C-4. The weld shall be made in a groove as shown. Each specimen shall be saw-notched from both edges at the center of the weld and shall be broken by pulling or hammer blows at the center of one end. The exposed surface of the specimen shall be visually examined and shall be considered acceptable if it meets the following criteria:

- a. No gas pockets exceeding $\frac{1}{16}$ in. (1.59 mm) in any direction.
- b. Not more than one gas pocket of any size for specified wall thicknesses of 0.250 in. (6.4 mm) and less.
- c. Not more than two gas pockets of any size for specified wall thicknesses of 0.500 in. (12.7 mm) or less but greater than 0.250 in. (6.4 mm).
- d. Not more than three gas pockets of any size for specified wall thicknesses greater than 0.500 in. (12.7 mm).
- e. Slag inclusions shall be separated by at least $\frac{1}{2}$ in. (12.7 mm) of sound metal and shall appear no greater than $\frac{1}{16}$ in. (1.59 mm) in width or $\frac{3}{16}$ in. (4.76 mm) in length.

C.3 Welding Personnel Performance Qualification

C.3.1 QUALIFICATION

C.3.1.1 General

Each repair welder and operator is required to qualify. A repair welder or operator qualified on one grade category is qualified for any lower grade category provided the same welding process is used.

C.3.1.2 Testing

To qualify, a repair welder or operator shall produce welds that are acceptable in the following tests:

- a. Film radiographic examination per Section 9 of this specification.
- b. Two transverse guided-bend tests per C.2.2.3 of this appendix.
- c. Two nick-break tests per C.2.2.4 of this appendix.

C.3.1.3 Test Failures

If one or more of the tests in C.3.1.2 fail to meet the specified requirements, the welder or operator may make one additional qualification weld. If that weld fails one or more of the tests in C.3.1.2, the welder or operator is disqualified. No further retests shall be permitted until the welder has completed additional training.

C.3.2 REQUALIFICATION

Requalification in accordance with C.3.1 is required under the following circumstances:

- a. One year has elapsed since the last prior applicable qualification.
- b. The individual has not been welding using qualified procedures for a period of 3 months.
- c. There is reason to question the individual's ability.

Note: Weld reinforcement shall be removed from both faces.

Figure C-1—Transverse Tensile Test Specimen

Note: Weld reinforcement shall be removed.

Figure C-2—Guided-Bend Test Specimen

Figure C-4—Nick-Break Test Specimen

Table C-1—Guided-Bend Test Jig Dimensions

(1)	(2)	(3)	(4)	(5)	(6)
Member Dimension	Pipe Grade ^a				
	A, B, & X42	X46	X52 & X56	X60 & X65	X70 & X80
Radius of male member, R_A	$3t$	$3\frac{1}{2}t$	$4t$	$4\frac{1}{2}t$	$5t$
Radius of female member, R_B	$4t + \frac{1}{16}$ in. ($4t + 1.6$ mm)	$4\frac{1}{2}t + \frac{1}{16}$ in. ($4\frac{1}{2}t + 1.6$ mm)	$5t + \frac{1}{16}$ in. ($5t + 1.6$ mm)	$5\frac{1}{2}t + \frac{1}{16}$ in. ($5\frac{1}{2}t + 1.6$ mm)	$6t + \frac{1}{16}$ in. ($6t + 1.6$ mm)
Width of male member, A	$6t$	$7t$	$8t$	$9t$	$10t$
Width of groove in female member, B	$8t + \frac{1}{8}$ in. ($8t + 3.2$ mm)	$9t + \frac{1}{8}$ in. ($9t + 3.2$ mm)	$10t + \frac{1}{8}$ in. ($10t + 3.2$ mm)	$11t + \frac{1}{8}$ in. ($11t + 3.2$ mm)	$12t + \frac{1}{8}$ in. ($12t + 3.2$ mm)

Notes:

1. See Figure C-3.

2. t = specified wall thickness of the pipe.^aFor intermediate grades of pipe, the dimensions of the bending jig shall conform to those shown for the next lower grade or shall be proportional thereto.

APPENDIX D—ELONGATION TABLE (NORMATIVE)

These minimum elongation values were calculated by the equation in Footnote a of Tables 3A and 3B.

Table D-1 —Elongation Table (U. S. Customary Units)

APPENDIX E—DIMENSIONS, WEIGHTS, AND TEST PRESSURES—SI UNITS (NORMATIVE)

Tables E-6A, E-6B, and E-6C provide the SI unit values for dimensions, weights per unit length, and test pressures, corresponding to the U.S. Customary unit values given in Tables 6A, 6B, and 6C.

Table E-6A—Plain-End Line Pipe Dimensions, Weights per Unit Length, and Test Pressures for Sizes 0.405 Through 1.900 (SI Units)

(1)	(2)	(3)	(4)	(5)	(6)	(7)	(8)	(9)	(10)
Size	Specified Outside Diameter <i>D</i> (mm)	Specified Wall Thickness <i>t</i> (mm)	Plain-End Weight per Unit Length <i>w_{pe}</i> (kg/m)	Calculated Inside Diameter ^a <i>d</i> (mm)	Grade A25	Minimum Test Pressure ^b (kPa × 100) ^c

1.900	48.3	10.2	9.58	27.9	96	152	—	158	—

Note: See Table 6A for U.S. Customary unit values corresponding to the SI unit values given in this table.

^aThe calculated inside diameters are given here for information (see 7.2).

^bThe test pressures given in E-6A, E-6B, and E-6C apply to Grades A25, A, B, X42, X46, X52, X56, X60, X65, X70, and X80 only. See 9.4.3 for pressures applicable to other grades.

^c100 kPa = 1 bar.

Table E-6B — Plain-End Line Pipe Dimensions, Weights per Unit Length, and Test Pressures for Sizes 2³/₈ through 5⁹/₁₆ (SI Units)

					Grade A25	Grade A	Grade B	Grade X42	Grade X46	Grade X52	Grade X56	Grade X60	Grade X65	Grade X70	Grade X80
5 ⁹ / ₁₆	141.3	19.1	57.56	103.1	Std.	193	193	193	207	207	207	207	207	207	207
					Alt.	—	193	193	500	500	500	500	500	500	500

Note: See Table 6B for US Customary unit values corresponding to the SI unit values given in this table.

^aThe calculated inside diameters are given here for information (see 7.2).

^bThe test pressures given in Tables E-6A, E-6B, and E-6C apply to Grades A25, A, B, X42, X46, X52, X56, X60, X65, X70, and X80 only. See 9.4.3 for pressures applicable to other grades.

^c100 kPa = 1 bar.

^dPipe that has this combination of specified outside diameter and specified wall thickness is special plain-end pipe; other combinations given in this table are regular plain-end pipe. Pipe that has a combination of specified outside diameter and specified wall thickness that is intermediate to the tabulated values is considered to be special plain-end pipe if the next lower tabulated value is for special plain-end pipe; other intermediate combinations are considered to be regular plain-end pipe. (See Table 10 for the applicable weight tolerances.)

Note: See Table 6C for U.S. Customary unit values corresponding to the SI unit values given in this table.

^aThe calculated inside diameters are given here for information (see 7.2).

^bThe test pressures given in Tables E-6A, E-6B, and E-6C apply to Grades A25, A, B, X42, X46, X52, X56, X60, X65, X70, and X80 only. See 9.4.3 for pressures applicable to other grades.

^c100 kPa = 1 bar.

^dPipe that has this combination of specified outside diameter and specified wall thickness is special plain-end pipe; other combinations given in this table are regular plain-end pipe. Pipe that has a combination of specified outside diameter and specified wall thickness that is intermediate to the tabulated values is considered to be special plain-end pipe if the next lower tabulated value is for special plain-end pipe; other intermediate combinations are considered to be regular plain-end pipe. (See Table 10 for the applicable weight tolerances.)

APPENDIX F—SUPPLEMENTARY REQUIREMENTS (NORMATIVE)

When specified on the purchase order, the following supplementary requirements (SR) shall apply.

SR3 Color Identification

SR3.1 For Grades X46 and higher of pipe sizes 4¹/₂ and larger shall be identified by color in accordance with the color code given in SR3.3.

SR3.2 The manufacturer shall apply a 2 in. (50 mm) daub of paint of the appropriate color on the inside surface at one end of each length of pipe.

SR3.3 The grade identification colors are as follows:

Grade	Color
X46	Black
X52	Green
X56	Blue
X60	Red
X65	White
X70	Purple
X80	Yellow

SR4 Nondestructive Inspection of Seamless Line Pipe

SR4.1 SUPPLEMENTARY NONDESTRUCTIVE INSPECTION

Seamless pipe shall be inspected full length for longitudinal defects by either magnetic particle inspection or by ultrasonic or electromagnetic methods. The location of the equipment in the mill shall be at the discretion of the manufacturer; however, the nondestructive inspection shall take place after all heat treating and expansion operations, if performed, but may take place before cropping, beveling, and end sizing.

SR4.2 MAGNETIC PARTICLE INSPECTION

When magnetic particle inspection is employed to inspect for longitudinal defects, the entire outside surface shall be inspected. The depth of all imperfections revealed by magnetic particle inspection shall be determined; and when found to be greater than 12¹/₂% of the specified wall thickness, the imperfection shall be considered a defect. Pipe containing defects shall be given one of the dispositions specified in 9.7.6.

SR4.3 ULTRASONIC OR ELECTROMAGNETIC INSPECTION

SR4.3.1 Equipment

Any equipment utilizing the ultrasonic or electromagnetic principles and capable of continuous and uninterrupted inspection of the entire outer surface of the pipe may be used.

The equipment shall be of sufficient sensitivity to indicate defects and shall be checked as prescribed in SR4.3.2.

SR4.3.2 Reference Standards

At least once per 8 hours per operating shift, a reference standard having the same specified diameter and thickness as the product being inspected shall be used to demonstrate the effectiveness of the inspection equipment and procedures. The reference standard may be of any convenient length as determined by the manufacturer. It shall be scanned by the inspection unit in a manner simulating the inspection of the product. For ultrasonic inspection, the reference standard shall contain a machined notch as specified in Figure F-1. For electromagnetic inspection, the reference standard shall contain either a machined notch as specified in Figure F-1 or a ¹/₈ in. (3.2 mm) drilled hole (see Note 1). The notch shall be in the outer surface of the reference standard and parallel to the longitudinal axis of the pipe or, at the option of the manufacturer, may be oriented at such an angle as to optimize the detection of anticipated defects (see Note 2). The ¹/₈ in. (3.2 mm) hole shall be drilled radially through the wall of the reference standard. The inspection equipment shall be adjusted to produce a well-defined indication when the reference standard is scanned by the inspection unit.

Note 1: The reference standards defined above are convenient standards for calibration of nondestructive testing equipment. The dimensions of these standards should not be construed as the minimum size imperfection detectable by such equipment.

Note 2: Reference standards other than the specific notch described above may be used by agreement between the purchaser and the manufacturer.

SR4.3.3 Acceptance Limits

Any imperfection that produces a signal greater than the signal received from the reference standard shall be considered a defect unless it can be demonstrated by the manufacturer that the imperfection does not exceed the provisions of 7.8. Pipe containing defects shall be given one of the dispositions specified in 9.7.6.

SR4.4 MARKING

Pipe nondestructively inspected in accordance with this supplementary requirement shall be marked SR4.

SR5 Fracture Toughness Testing (Charpy V-Notch) for Pipe of Size 4¹/₂ or Larger

SR5.1 The manufacturer is responsible for the performance of Charpy V-notch tests in accordance with ASTM A 370, *Methods and Definitions for Mechanical Testing of*

Steel Products, as modified herein. Either or both toughness criteria (SR5A—Shear Area or SR5B—Absorbed Energy) may be specified under this supplementary requirement.

SR5.2 The following applies to all specified limits and observed values to be used in connection with this supplementary requirement.

For purposes of determining conformance with these supplementary requirements, an observed value shall be rounded to the nearest whole number in accordance with the rounding-off method of ASTM E 29, *Practice for Using Significant Digits in Test Data to Determine Performance With Specifications*. Further, limiting values as specified or calculated under this supplementary requirement shall be expressed as whole numbers rounded, if necessary.

SR5.3 Except for flattened specimens, the requirements of this supplementary requirement are limited to pipe sizes and wall thicknesses from which a $1/2$ size specimen may be secured.

The specimen shall be oriented circumferentially from a location 90° from the weld with the axis of the notch oriented through the pipe wall thickness as shown in Figure F-3.

SR5.4 Except as limited by Item c below, any of the following Charpy V-notch specimens are permissible by agreement between the purchaser and the manufacturer.

a. Full-size specimens. Full-size specimens (10 mm by 10 mm) with or without tapered ends may be used (see note below and Figure F-2).

b. Subsize specimens. The largest possible subsize specimen (see Table F-1) with or without tapered ends may be used. All dimensions other than specimen width are the same as the full-size specimen. Selecting subsize specimens for pipe whose size permits full-size specimens is also permissible by agreement between the purchaser and the manufacturer.

c. Flattened specimens. When because of combinations of diameter and wall thickness the use of $2/3$ size tapered end specimens is not practicable (see Table F-1), flattened specimens, $1/2$ size conventional specimens, or $1/2$ size tapered end specimens shall be used by agreement between the purchaser and the manufacturer. Flattened specimens may be flattened at room temperature in the same manner as transverse tensile strip specimens are prepared. Hot flattening, artificial aging, or heat treatment of flattened specimens is not permitted.

The flattened specimens shall have OD and ID surfaces machined no more than sufficient to make them parallel, or the surfaces shall be wire brushed or cleaned without machining. The specimen width shall essentially represent the full wall thickness of the pipe. All dimensions other than specimen width shall be the same as full-size specimens. The user is cautioned that results of flattened specimens and full-size

or subsize specimens may not be correlated or directly compared with one another.

Note: "Tapered end specimens" are designated as "tubular impact specimens containing original OD surface" in ASTM A 370. This terminology is not used here because of possible confusion with the flattened specimens permitted in this SR; flattened specimens may also contain the original OD surface (but not curvature), since machining of flattened specimens is not required by this SR.

SR5.5 If any Charpy V-notch test result for a heat of pipe fails to conform to the applicable requirements of SR5A or SR5B, the manufacturer may elect to heat treat the heat of pipe in accordance with the requirements of 5.4, consider it to be a new heat, test it in accordance with all requirements of 6.2, 9.3, SR5, and SR6 that are applicable to the order item, and proceed in accordance with the applicable requirements of this specification. After one reprocessing heat treatment, any additional reprocessing heat treatment shall be subject to agreement with the purchaser.

For non-heat treated pipe, any reprocessing heat treatment shall be subject to agreement with the purchaser. For heat treated pipe, any reprocessing with a different type of heat treatment (see 5.4) shall be subject to agreement with the purchaser.

SR5A Shear Area

SR5A.1 Three transverse specimens shall be taken from one length of pipe from each heat supplied on the order.

SR5A.2 The specimens shall be tested at 50°F (10°C) or at a lower temperature as specified by the purchaser. The average shear value of the fracture appearance of the three specimens shall not be less than 60%, and the all-heat average for each order per diameter size and grade shall not be less than 80%.

SR5A.3 If the average of the three specimens from one heat does not meet the requirement of 60% shear, the manufacturer may elect to repeat the tests on specimens cut from two additional lengths of pipe from the same heat. If such specimens conform to the specified requirements, all the lengths in the heat shall be accepted except the length initially selected for test. If any of the retest specimens fail to pass this specified retest requirement, the manufacturer may elect to test specimens cut from the individual lengths remaining in the heat.

SR5A.4 The average shear value for a heat shall be the average of the original three specimens if the average is 60% or more; the combined average of the retest specimens, provided the average of each group of three specimens is 60% or more; or, in the event individual lengths are tested, the combined average of all groups of three specimens that meet 60%. The all-heat average value is the combined average of the average shear value for each of the heats supplied for the order item.

SR5A.5 If the all-heat average of the order does not meet the requirement of 80% shear, the manufacturer shall be responsible for replacement of such heats as may be necessary to bring the average shear area up to 80%.

SR5A.6 Alternatively, the manufacturer may elect to test two or more additional lengths from one or more of the heats. In determining the new heat average, the original test values may be discarded if the pipe length represented is rejected or the three or more individual values are averaged. In any case, the new test values shall be incorporated into the value for the heat.

SR5A.7 Specimens showing material defects or defective preparation, whether observed before or after breaking, may be discarded and replacements shall be considered as original specimens.

SR5A.8 Marking. Pipe tested in accordance with the shear area requirements of this supplementary requirement shall be marked to indicate the type of test, the test temperature, and if flattened specimens are used, the type of specimen. Temperatures below zero shall be preceded by the letter M.

Example at + 32°F:	SR5A-32F
Example of flattened specimen	
at – 40°C:	SR5AF-M40C

SR5B Absorbed Energy

SR5B.1 The fracture toughness of the pipe shall be determined using Charpy V-notch impact test specimens in accordance with ASTM A 370, as modified herein, and the requirements of SR5A.1, except that test frequency shall be as indicated in SR5B.2. The purchaser shall specify, in whole numbers, both the test temperature and the minimum average absorbed energy for full-size specimens.

Specimens used for shear area determination according to SR5A may be additionally used for the determination of absorbed energy.

SR5B.2 Three transverse specimens representing one test shall be taken from one length of pipe from each inspection lot of 100 lengths per heat produced. An inspection lot shall consist of pipe that is made to the same size and same specified wall thickness by the same process and under the same manufacturing conditions.

SR5B.3 For acceptance, the average absorbed energy of the three individual specimens from a length shall not be less than the full-size value specified by the purchaser. In addition, the lowest individual reading of the three specimens shall not be less than 75% of the specified value. When subsize specimens are used, the individual readings and the average of the three readings are divided by the ratio of the specimen thickness tested to the full-size specimen thickness and compared with the full-size acceptance criteria. When flattened specimens are used, each of the three individual impact energy readings shall

be multiplied by 0.3937 (10), and divided by the actual measured specimen width, in inches (millimeters). These results, and the average of the three results, shall meet the specified absorbed energy acceptance criteria for full-size specimens.

SR5B.4 Specimens showing material defects or defective preparations, whether observed before or after breaking, may be discarded and replacements shall be considered original specimens.

In the event a set of test specimens fails to meet the acceptance criteria, the manufacturer may elect to replace the lot of material involved or alternatively to test two more lengths from the same lot. If both of the new tests meet the acceptance criteria, then all pipe in that lot with the exception of the original selected length shall be considered to meet the requirement. Failure of either of the two additional tests shall require testing of each length in the lot for acceptance.

SR5B.5 Pipe complying with the absorbed energy requirements of this supplementary requirement shall be marked to indicate the type of test, the specified [full-size] minimum average absorbed energy, the test temperature, and, if flattened specimens are used, the type of specimen. Temperatures below zero shall be preceded by the letter M, and absorbed energy specified in joules shall be followed by the letter J.

SR6 Drop-Weight Tear Testing on Welded Pipe of Size 20 or Larger, Grade X52 or Higher

SR6.1 Fracture toughness of pipe sizes 20 and larger, Grade X52 and higher, shall be determined by the manufacturer using drop-weight tear tests in accordance with the following requirements in SR6.2 through SR6.8.

SR6.2 Two transverse specimens shall be taken from one length of pipe from each heat supplied on the order. The specimens shall be oriented circumferentially from a location 90° from the weld with the axis of the notch oriented through the pipe wall thickness as shown in Figure F-3. The specimens shall be tested at 50°F (10°C) or at a lower temperature as specified by the purchaser.

SR6.3 The test specimens, testing procedure, and rating of the specimens shall be in accordance with API Recommended Practice 5L3. The type of notch (pressed or chevron) shall be selected by agreement between the manufacturer and the purchaser.

SR6.4 At least 80% of the heats shall exhibit a fracture appearance shear area of 40% or more for the specified test temperature (see note).

Note: Due to manufacturing difficulties encountered with thicker materials, pipe manufacturers may not be able to offer pipe in all grades that meet this requirement.

SR6.5 In the event the average value of the two specimens from the length selected to represent the heat is less than 40%, the manufacturer may elect to establish the heat average by testing two specimens from each of two or more additional lengths of pipe in the heat. In establishing the new heat average, the manufacturer may elect (a) to employ the combined average of the three tests or more; or (b) to discard the result of the first test, reject the pipe from which it was taken, and employ the combined average of the two or more additional tests. Alternatively, the manufacturer may elect to test all the pipe in the heat, in which case 80% or more of the lengths tested and applied to the order shall exhibit an average of 40% or more shear.

SR6.6 Specimens showing material defects or defective preparation, whether observed before or after breaking, may be discarded, and replacements shall be considered as original specimens.

SR6.7 The manufacturer shall be responsible for replacement of such heats as may be necessary to meet the above requirements.

SR6.8 Pipe tested in accordance with SR6 shall be marked to indicate the type of test, the type of notch, and the testing temperature. Temperatures below zero shall be preceded by the letter M.

Example for chevron notch at 32°F: SR6C-32F

Example for pressed notch at – 10°C: SR6P-M10C

SR7 Through-the-Flowline (TFL) Pipe

SR7.1 GENERAL

TFL pipe shall comply with all requirements of this specification and the additional requirements specified in SR7.2 through SR7.6.

SR7.2 DIMENSION AND GRADES

TFL pipe shall be seamless or longitudinal seam pipe in the outside diameters, wall thicknesses, and grades listed in Table F-2.

SR7.3 LENGTH

Unless otherwise specified, TFL pipe shall be furnished only in double random lengths with no jointers (girth welds).

SR7.4 DRIFT TESTS

Each length of TFL pipe shall be tested throughout its entire length with a cylindrical drift mandrel conforming to the requirements listed below. The leading edge of the drift mandrel shall be rounded to permit easy entry into the pipe. The drift mandrel shall pass freely through the pipe with a reasonable exerted force equivalent to the weight of the mandrel being used for the test. Pipe shall not be rejected until it has been drift tested when it is free of all foreign matter and properly supported to prevent sagging.

Size	Drift Mandrel Size			
	Length		Diam., min.	
	in.	mm	in.	mm
< 3 ¹ / ₂	42	1066	d – ³ / ₃₂	d – 2.4
≥ 3 ¹ / ₂	42	1066	d – ¹ / ₈	d – 3.2

SR7.5 HYDROSTATIC TESTS

TFL pipe shall be hydrostatically tested in accordance with the requirements of 9.4, except that the minimum test pressures shall be as shown in Table F-2. These test pressures in Table F-2 represent the lesser of 10,000 psi (68 900 kPa) and the pressure calculated with the equation given in 9.4.3, using a fiber stress (S) equal to 80 percent of the specified minimum yield strength.

SR7.6 MARKING

TFL pipe manufactured in accordance with SR7 shall be marked with the letters TFL in addition to the marking required in Section 10 or Appendix I.

SR15 Test Certificates and Traceability for Line Pipe

SR15.1 The manufacturer shall provide the following data, as applicable, for each order item for which this supplementary requirement is specified on the purchase order. The manufacturer's certificate of compliance shall state the API specification and date of revision to which pipe was manufactured. A Material Test Report, Certificate of Compliance, or similar document printed from or used in electronic form from an electronic data interchange (EDI) transmission shall be regarded as having the same validity as a counterpart printed in the manufacturer's facility. The content of the EDI transmitted document must meet the requirements of this specification and conform to any existing EDI agreement between the purchaser and the manufacturer.

a. Specified outside diameter, specified wall thickness, grade, process of manufacture, and type of heat treatment.

- b. Chemical analyses (heat, product, control, and recheck) showing the weight percent of all elements whose limits or reporting requirements are set in this specification; for PSL 2 pipe, carbon equivalent and applicable maximum allowable value. If order is for by-agreement "high carbon equivalent pipe," that designation shall be included.
- c. Test data for all tensile tests required by this specification, including yield strength, ultimate tensile strength, and elongation. The type, size, and orientation of specimens shall be shown.
- d. Fracture toughness test results (including test type and criteria and the size, location, and orientation of the specimen) where such testing is required.
- e. Minimum hydrostatic test pressure and duration.
- f. For welded pipe for which nondestructive inspection of the weld seam is required by this specification, the method of nondestructive inspection employed (radiological, ultrasonic, electromagnetic, and/or magnetic particle), and the type and size of all penetrameters and reference standards used.
- g. For seamless pipe for which nondestructive inspection (SR4) is required, the method of inspection employed (ultrasonic, electromagnetic, or magnetic particle) and the type and size of the reference standard used.
- h. For electric welded pipe and laser welded pipe, the minimum temperature for heat treatment of the weld seam. Where such heat treatment is not performed, the words "No Seam Heat Treatment" shall be stated on the certificate.
- i. Results of any supplemental testing required by the purchaser.

SR15.2 The manufacturer shall establish and follow procedures for maintaining heat and lot identity of all pipe covered by this supplementary requirement. The procedures shall provide means for tracing any length of pipe or coupling to the proper heat and lot and to all applicable chemical and mechanical test results.

SR17 Nondestructive Inspection of Welds in Electric Welded Pipe and Laser Welded Pipe

SR17.1 SUPPLEMENTARY NONDESTRUCTIVE INSPECTION

The weld in electric welded pipe shall be inspected full length for surface and subsurface defects by either ultrasonic or electromagnetic methods. The weld in laser-welded pipe shall be inspected full length for surface and subsurface defects by ultrasonic methods. The location of the equipment in the mill shall be at the discretion of the manufacturer. However, the nondestructive inspection shall take place after all heat treating, hydrostatic testing, expansion, and rotary straightening operations, if performed, but may take place before cropping, beveling, and sizing of pipe.

SR17.2 EQUIPMENT AND REFERENCE STANDARDS

The ultrasonic or electromagnetic inspection equipment requirements are given in 9.7.4.1, and the reference standards are described in 9.7.4.2. Details of the specific techniques (such as method, reference standards, transducer properties, and sensitivity) shall be agreed upon between the purchaser and the manufacturer for the implementation of this supplementary requirement.

SR17.3 ACCEPTANCE LIMITS AND EMI INSPECTIONS

Table 21 gives the height of acceptance limit signals in percent of height of signals produced by reference standards. An imperfection that produced a signal greater than the acceptance limit signal given in Table 21 shall be classified as a defect.

SR17.4 DISPOSITION

Defects shall be disposed of in accordance with 9.7.6, Items a, c, and d. Repair by welding is not permitted. If a defect is removed by grinding, the ground area shall be re-inspected by the same method originally used.

SR17.5 MARKING

Pipe nondestructively inspected in accordance with this supplementary requirement shall be marked SR17.

SR18 Carbon Equivalent

SR18.1 For pipe grades up to Grade X70 inclusive, the carbon equivalent, CE, calculated using product analysis and the following equation shall not exceed 0.43%:

$$CE = C + \frac{Mn}{6} + \frac{Cr + Mo + V}{5} + \frac{Ni + Cu}{15}$$

SR18.2 The elements analyzed for product analysis shall include all elements contained in the carbon equivalent equation.

SR19 Additional Fracture Toughness Requirements (Transverse Charpy V-Notch) for PSL 2 Pipe

SR19.1 Except as allowed by SR19.2, fracture toughness testing shall be performed in accordance with the requirements of 9.3.5.1 and 9.3.5.2, with a test temperature of 32°F (0°C) or a lower temperature as specified on the purchase order. The required minimum all-heat average full-size absorbed energy value shall be the greater of

- a. 30 ft-lb (40 J) for grades below Grade X80, 60 ft-lb (80 J) for Grade X80 pipe; and

b. The value obtained from the following equation, using a stress factor (F) of 0.72 or a higher value if specified on the purchase order, and rounding the calculated value to the nearest foot-pound (joule):

U.S. Customary Unit Equation SI Unit Equation

$$CV = 0.0345(F\sigma_y)^{\frac{3}{2}}\left(\frac{D}{2}\right)^{\frac{1}{2}} \quad CV = 0.000512(F\sigma_y)^{\frac{3}{2}}\left(\frac{D}{2}\right)^{\frac{1}{2}}$$

where

CV = minimum all-heat average full-size Charpy V-notch absorbed energy requirement, ft-lb (J),

F = stress factor,

σ_y = specified minimum yield strength, ksi (MPa),

D = specified outside diameter, in. (mm).

Notes:

1. See Table F-3 for the required minimum all-heat-average absorbed energy values for pipe having a standard size and grade, and a stress factor of 0.72.

2. The above equation is one of a number of such relationships derived from full-scale burst test data for a limited number of sizes and grades (see ASME B31.8). It is also judged to be conservative for initiation conditions in pipelines.

SR19.2 Pipe tested at a lower temperature than is required in SR19.1 shall be acceptable if it meets the required absorbed energy values.

SR19.3 Pipe tested in accordance with SR19 shall be marked to indicate the specified (full-size) minimum all-heat average absorbed energy value and the specified test temperature. Temperatures below zero shall be preceded by the letter M, and the absorbed energy specified in joules shall be followed by the letter J.

Example for 30 ft-lb at + 32°F:

SR19-30-32F

Example for 70 J at – 5°C:

SR19-70J-M5C

Depth of notch, h , shall be 12½% of the nominal wall thickness of the pipe being inspected, but not less than 0.012 in. (0.30 mm).

For ultrasonic and eddy current the length of notch at full depth, L , shall be at least twice the width of the scanning head.

For diverted flux the length of notch shall be as required by the equipment design to provide a reproducible signal when the reference standard is passed through the equipment at the inspection line speed for the pipe being inspected. Three passes through the equipment shall be required to ensure reproducibility.

APPENDIX H—PURCHASER INSPECTION (NORMATIVE)

H.1 Inspection Notice

Where the inspector representing the purchaser desires to inspect pipe or witness tests, reasonable notice shall be given of the time at which the run is to be made.

H.2 Plant Access

The inspector representing the purchaser shall have unrestricted access, at all times while work on the contract of the purchaser is being performed, to all parts of the manufacturer's works that will concern the manufacture of the pipe ordered. The manufacturer shall afford the inspector all reasonable facilities to satisfy the inspector that the pipe is being manufactured in accordance with this specification. All inspections should be made at the place of manufacture prior to shipment, unless otherwise specified on the purchase order, and shall be so conducted as not to interfere unnecessarily with the operation of the works.

H.3 Compliance

The manufacturer is responsible for complying with all of the provisions of this specification. The purchaser may make any investigation necessary to satisfy himself of compliance by the manufacturer and may reject any material that does not comply with this specification.

H.4 Rejection

Unless otherwise provided, material that shows defects on inspection or subsequent to acceptance at the manufacturer's works, or material that proves defective when properly applied in service, may be rejected and the manufacturer so notified. If tests that require the destruction of material are made, any product proven not to have met the requirements of the specification shall be rejected. Disposition of rejected product shall be a matter of agreement between the manufacturer and the purchaser.

APPENDIX I—MARKING INSTRUCTIONS FOR API LICENSEES (NORMATIVE)

I.1 General

The marking requirements in this appendix apply to licensed manufacturers using the API monogram on products covered by this specification.

Pipe and pipe couplings manufactured in conformance with this specification may be marked by the licensee as specified in Appendix I or Section 10. Products to which the monogram is applied shall be marked as specified in Appendix I.

I.1.1 The required marking on pipe shall be as stipulated hereinafter.

I.1.2 The required marking on couplings shall be die stamped unless otherwise agreed between the purchaser and the manufacturer, in which case they shall be paint stenciled.

I.1.3 Additional markings, including those for compatible standards following the specification marking, are allowed and may be applied as desired by the manufacturer or as requested by the purchaser.

I.2 Location of Markings

The location of identification markings shall be as specified in I.2.1 – I.2.3.

I.2.1 SIZES 1.900 AND SMALLER

The marking is die stamped on a metal tag fixed to the bundle, or may be printed on the straps or banding clips used to tie the bundle.

I.2.2 SEAMLESS PIPE IN ALL OTHER SIZES AND WELDED PIPE SMALLER THAN SIZE 16

Paint stencil on the outside surface starting at a point between 18 in. and 30 in. (460 and 760 mm) from the end of the pipe, and in the sequence shown in I.3, except when agreed between the purchaser and the manufacturer, some or all of the markings may be placed on the inside surface in a sequence convenient to the manufacturer.

I.2.3 WELDED PIPE SIZES 16 AND LARGER

Paint stencil on the inside surface starting at a point no less than 6 in. from the end of the pipe in a sequence convenient to the manufacturer, unless otherwise specified by the purchaser.

I.3 Sequence of Markings

The sequence of identification markings shall be as specified in I.3.1 – I.3.10.

I.3.1 MANUFACTURER'S API LICENSE NUMBER

The manufacturer's API license number shall be marked. (The manufacturer's name or mark is optional.)

I.3.2 API MONOGRAM ([MONOGRAM]) AND DATE

The API monogram () immediately followed by the date of manufacture (defined as the month and year when the monogram is applied), shall be applied only to products complying with the requirements of the specification and only by authorized manufacturers.

I.3.3 COMPATIBLE STANDARDS

Products in compliance with multiple compatible standards may be marked with the name of each standard.

I.3.4 SPECIFIED DIMENSIONS

The specified outside diameter and the specified wall thickness shall be marked, except that, for the specified outside diameter, any ending zero digits to the right of the decimal need not be included in such markings.

I.3.5 GRADE AND CLASS

The symbols to be used are as follows:

Grade (see Note)	Symbol
Grade A25-Class I	A25
Grade A25-Class II	A25R
Grade A	A
Grade B	B
Grade X42	X42
Grade X46	X46
Grade X52	X52
Grade X56	X56
Grade X60	X60
Grade X65	X65
Grade X70	X70
Grade X80	X80

Note: See I.3 for limitations on down-grading.

For grades intermediate to X42 and X80, the symbol shall be X followed by the first two digits of the specified minimum yield strength in U.S. Customary units.

By agreement between the purchaser and the manufacturer and when so specified on the purchase order, the grade shall be identified by color in accordance with SR3.

I.3.6 PRODUCT SPECIFICATION LEVEL

The symbols to be used are as follows:

- | | |
|----------|------|
| a. PSL 1 | PSL1 |
| b. PSL 2 | PSL2 |

The PSL marking shall be placed immediately after the grade symbol.

I.3.7 PROCESS OF MANUFACTURE

The symbols to be used are as follows:

- | | |
|---|---|
| a. Seamless pipe | S |
| b. Welded pipe, except continuous welded and laser welded | E |
| c. Continuous welded pipe | F |
| d. Laser welded pipe | L |

I.3.8 HEAT TREATMENT

The symbols to be used are as follows:

- | | |
|--|----|
| a. Normalized or normalized and tempered | HN |
| b. Subcritical stress relieved | HS |
| c. Subcritical age hardened | HA |
| d. Quench and Tempered | HQ |

I.3.9 TEST PRESSURE

When the specified hydrostatic test pressure is higher than the tabulated standard pressure (Tables 4, 5, 6A, 6B, 6C, E-6A, E-6B, or E-6C, whichever is applicable), the word "TESTED" shall be marked, immediately followed by the specified test pressure (in pounds per square inch for pipe ordered in U.S. Customary units, or in hundreds of kilopascals for pipe ordered in SI units).

I.3.10 SUPPLEMENTARY REQUIREMENTS

See Appendix F for supplementary requirements.

I.3.11 EXAMPLES

- a. Size 14, 0.375 in. (9.5 mm) specified wall thickness, Grade B, PSL 2, seamless, plain-end pipe should be paint stenciled as follows, using the values that are appropriate for the pipe dimensions specified on the purchase order:

5LXXXX.X \diamond (MO-YR) 14 0.375 B PSL2 S

or

5LXXXX.X \diamond (MO-YR) 355.6 9.5 B PSL2 S

- b. Size 6⁵/₈, 0.280 in. (7.1 mm) specified wall thickness, Grade B, PSL 1, electric welded, plain-end pipe should be paint stenciled as follows, using the values that are appropriate for the pipe dimensions specified on the purchase order:

5LXXXX.X \diamond (MO-YR) 6.625 0.280 B PSL1 E

or

5LXXXX.X \diamond (MO-YR) 168.3 7.1 B PSL1 E

- c. Size 4¹/₂, 0.237 in. (6.0 mm) specified wall thickness, Grade A25, Class I, continuous welded, threaded-end pipe should be paint stenciled as follows, using the values that are appropriate for the pipe dimensions specified on the purchase order:

5LXXXX.X \diamond (MO-YR) 4.5 0.237 A25 PSL1 F

or

5LXXXX.X \diamond (MO-YR) 114.3 6.0 A25 PSL1 F

- d. Size 14, 0.375 in. (9.5 mm) specified wall thickness, Grade X70, PSL 2, seamless, quenched and tempered, plain-end pipe should be paint stenciled as follows, using the values that are appropriate for the pipe dimensions specified on the purchase order:

5LXXXX.X \diamond (MO-YR) 14 0.375 X70

PSL2 S HQ

or

5LXXXX.X \diamond (MO-YR) 355.6 9.5 X70

PSL2 S HQ

- e. Size 12³/₄, 0.330 in. (8.4 mm) specified wall thickness, Grade X42, PSL 1, seamless plain-end pipe should be paint stenciled as follows, using the values that are appropriate for the pipe dimensions specified on the purchase order:

5LXXXX.X \diamond (MO-YR) 12.75 0.330 X42

PSL1 S

or

5LXXXX.X \diamond (MO-YR) 323.9 8.4 X42

PSL1 S

- f. Size 6⁵/₈, 0.216 in. (5.5 mm) specified wall thickness, Grade X42, PSL 1, laser welded, plain-end pipe should be paint stenciled as follows, using the values that are appropriate for the pipe dimensions specified on the purchase order:

5LXXXX.X \diamond (MO-YR) 6.625 0.216 X42

PSL1 L

or

5LXXXX.X \diamond (MO-YR) 168.3 5.5 X42

PSL1 L

g. Size 24, 0.406 in. (10.3 mm) specified wall thickness, Grade X42, PSL 2 helical seam submerged-arc welded plain-end pipe should be paint stenciled as follows, using the values that are appropriate for the pipe dimensions specified on the purchase order:

5LXXXX.X \diamond (MO-YR) 24 0.406 X42 PSL2 E

or

5LXXXX.X \diamond (MO-YR) 610 10.3 X42 PSL2 E

I.4 Bundle Identification

For pipe of size 1.900 or smaller, the identification markings specified in I.3 shall be placed on the tag, strap, or clip used to tie the bundle. For example, size 1.900, 0.145 in. (3.7 mm) specified wall thickness, Grade B, electric welded, plain-end pipe should be marked as follows, using the values that are appropriate for the pipe dimensions specified on the purchase order:

5LXXXX.X \diamond (MO-YR) 1.9 0.145 B PSL1 E

or

5LXXXX.X \diamond (MO-YR) 48.3 3.7 B PSL1 E

I.5 Length

In addition to the identification markings stipulated in I.2, I.0.3, and I.0.4, the length shall be marked as follows, using feet and tenths of a foot for pipe ordered in U.S. Customary units, or meters to two decimal places for pipe ordered in SI units, unless a different measuring and marking format has been agreed upon by the purchaser and manufacturer:

- For pipe larger than size 1.900, the length, as measured on the finished pipe, shall be paint stenciled on the outside surface at a location convenient to the manufacturer, or by agreement between the purchaser and the manufacturer, on the inside surface at a convenient location.
- For pipe of size 1.900 or smaller, the total length of pipe in the bundle shall be marked on the tag, band, or clip.

I.6 Couplings

All couplings in sizes $2\frac{3}{8}$ and larger shall be identified with the manufacturer's name or mark and the API monogram (\diamond), immediately followed by the date of manufacture (defined as the month and year when the monogram is applied).

I.7 Die Stamping

Cold die stamping of grades higher than A25 plate or pipe not subsequently heat treated and all pipe with wall thickness of 0.156 in. (4.0 mm) and less is prohibited, except that by

agreement between the purchaser and the manufacturer and when so specified on the purchase order, pipe or plate may be cold die stamped. The manufacturer at his option may hot die stamp [200°F (93°C) or higher] plate or pipe, cold die stamp plate or pipe if it is subsequently heat treated, and cold die stamp couplings. Cold die stamping shall be done with rounded or blunt dies. All die stamping shall be at least 1 in. (25 mm) from the weld for all grades except Grade A25.

I.8 Thread Identification

At the manufacturer's option, threaded-end pipe may be identified by stamping or stenciling the pipe adjacent to the threaded ends, with the threader's API license number, the API monogram (\diamond), immediately followed by the date of threading (defined as the month and year the monogram is applied), the specified outside diameter of the pipe, and LP to indicate the type of thread. The thread marking may be applied to products that do or do not bear the API monogram. For example, size $6\frac{5}{8}$ threaded-end pipe may be marked as follows, using the value that is appropriate for the pipe outside diameter specified on the purchase order:

5LXXXX.X \diamond (MO-YR of threading) 6.625 LP

or

5LXXXX.X \diamond (MO-YR of threading) 168.3 LP

If the product is clearly marked elsewhere with the manufacturer's identification, his license number, as above, may be omitted.

I.9 Thread Certification

The use of the monogram (\diamond) as provided in I.8 shall constitute a certification by the manufacturer that the threads so marked comply with the requirements stipulated in the latest edition of API Standard 5B but should not be construed by the purchaser as a representation that the product so marked is, in its entirety, in accordance with any API specification. Manufacturers who use the monogram (\diamond) for thread identification are required to have access to properly certified API reference master pipe gages.

I.10 Pipe Processor Markings

Pipe heat treated by a processor other than the original pipe manufacturer shall be marked as stipulated in I.1 through I.7. The processor shall remove any identification that is not indicative of a new condition of the product as a result of heat treating (such as, prior grade and original pipe manufacturer's name or logo).

APPENDIX J—SUMMARY OF DIFFERENCES BETWEEN PSL 1 AND PSL 2 (INFORMATIVE)

Parameter	PSL 1	PSL 2	Reference
Grade range	A25 through X70	B through X80	Table 1
Size range	0.405 through 80	4 ¹ / ₂ through 80	Table 1
Type of Pipe Ends	Plain-end, threaded-end; belled-end; special coupling pipe	Plain-end	Table 1
Seam welding	All methods; continuous welding limited to Grade A25	All methods except continuous and laser welding	Table 1
Electric welds: welder frequency	No minimum	100 kHz minimum	5.1.3.3.2
Heat treatment of electric welds	Required for grades > X42	Required for all grades (B through X80)	5.1.3.3.1; 5.1.3.3.2; 6.2.7
Chemistry: max C for seamless pipe	0.28% for grades ≥ B	0.24%	Tables 2A, 2B
Chemistry: max C for welded pipe	0.26% for grades ≥ B	0.22%	Tables 2A, 2B
Chemistry: max P	0.030% for grades ≥ A	0.025%	Tables 2A, 2B
Chemistry: max S	0.030%	0.015%	Tables 2A, 2B
Carbon Equivalent:	Only when purchaser specifies SR18	Maximum required for each grade	4.2; 4.3; 6.1.3; SR15.1
Yield Strength, Maximum	None	Maximum for each grade	Tables 3A, 3B
UTS, Maximum	None	Maximum for each grade	Tables 3A, 3B
Fracture Toughness	None required	Required for all grades	6.2.6; 9.3.5; 9.8.4; 9.10.7; Table 14
Nondestructive inspection of seamless	Only when purchaser specifies SR4	SR4 mandatory	9.7.2.6
Repair by welding of pipe body, plate, and skelp	Permitted	Prohibited	5.3.2; 9.7.6; B.1; B.2
Repair by welding of weld seams with- out filler metal	Permitted by agreement	Prohibited	4.3; 9.7.4.4; 9.7.6; B.1.2; B.4
Certification	Certificates when specified per SR15	Certificates (SR15.1) mandatory	12.1
Traceability	Traceable only until all tests are passed, unless SR 15 is specified	Traceable after completion of tests (SR15.2) mandatory	5.6

APPENDIX K—END LOAD COMPENSATION FOR HYDROSTATIC TEST PRESSURES IN EXCESS OF 90% OF SPECIFIED MINIMUM YIELD STRENGTH (NORMATIVE)

(By agreement between the purchaser and the manufacturer, the following method may be used to determine the hydrostatic test pressure.)

K.1 As a measure to prevent distortion when testing at pressures equivalent to stresses in excess of 90% of specified minimum yield strength, the manufacturer may apply a calculation to compensate for the forces applied to the pipe end that produce a compressive longitudinal stress. The calculation in this appendix is based on Barlow's equation (see 9.4.3) modified by a factor based on the Maximum Shear Theory (see note). The calculation may be applied only when testing in excess of 90% of the specified minimum yield strength. In no case may the gage pressure for testing be less than that calculated using Barlow's equation at 90% of specified minimum yield strength.

Note: The calculation is an approximation of the effective hoop stress (S_E), which is practical for application under mill pipe testing conditions. Other calculations provide closer approximations of effective hoop stress but are complex and therefore impractical for application.

K.2 The test pressure calculated shall be rounded to the nearest 10 psi (100 kPa).

K.3 The hydrostatic test pressure compensated for pipe end loading shall be calculated according to the following equation:

U.S. Customary Unit Equation:

$$P_1 = \frac{S_E - \frac{P_R A_R}{A_p}}{\frac{D}{2t} - \frac{A_1}{A_p}}$$

SI Unit Equation:

$$P_1 = 1000 \frac{S_E - \frac{P_R A_R}{A_p}}{\frac{D}{2t} - \frac{A_1}{A_p}}$$

where

A_1 = internal cross-sectional area of pipe,

A_p = cross-sectional area of pipe wall,

A_R = cross-sectional area of ram,

P_1 = hydrostatic test pressure in psi (kPa),

P_R = internal pressure on end-sealing ram,

S_E = effective hoop stress in psi (MPa) equal to a percentage of the specified minimum yield strength,

D = specified outside diameter, in. (mm),

t = specified wall thickness, in. (mm).

K.4 The above equation may be manipulated algebraically to provide calculation in other terms appropriate to the manufacturer's testing facility.

K.5 Appropriate techniques for the control of effective hoop stress based on measurements of internal pipe and ram pressures vary according to hydrotester system design. The manufacturer shall provide a control technique appropriate to his installation.

APPENDIX M—CONVERSION PROCEDURES

The following procedures were used to make the soft metric conversions of U.S. Customary units to SI units in the metric conversion of API Spec 5L.

M.1 Fractions

Fractions and numbers with fractions in U.S. Customary units were converted to the full decimal equivalent in U.S. Customary units without rounding, and the full decimal equivalents in U.S. Customary units were then converted to SI values using the following formula:

$$N_m = 25.4 \bullet N$$

where

N_m = the SI equivalent of dimensions with fractions in U.S. Customary units, mm,

N = the full decimal equivalent of dimensions with fractions without rounding, in.

The SI equivalents of dimensions with fractions in U.S. Customary units were then rounded to the appropriate number of places in mm.

M.2 Outside Diameter

The U.S. Customary values for outside diameters of pipe and couplings were converted to SI values using the following formula:

$$D_m = 25.4 \bullet D$$

where

D_m = SI outside diameter, mm,

D = outside diameter, in.

The SI outside diameters of pipe and couplings smaller than size 18 were rounded to the nearest 0.1 mm. The SI outside diameters of pipe and couplings size 18 and larger were rounded to the nearest 1.0 mm.

M.3 Wall Thickness

The U.S. Customary values for wall thickness were converted to SI values using the following formula:

$$t_m = 25.4 \bullet t$$

where

t_m = SI wall thickness, mm,

t = wall thickness, in.

The SI wall thicknesses were rounded to the nearest 0.1 mm.

M.4 Inside Diameter

The SI inside diameters of pipe were calculated (not converted) using the following formula:

$$d_m = D_m - 2 \bullet t_m$$

where

d_m = SI inside diameter, mm,

D_m = SI outside diameter, mm,

t_m = SI wall thickness, mm.

The SI inside diameters were rounded to the nearest 0.1 mm.

M.5 Plain End Linear Density

The SI plain end linear densities were calculated (not converted) using the following formula:

$$W_{pem} = 0.0246615(D_m - t_m)t_m$$

where

W_{pem} = SI plain end linear density, kg/m,

D_m = SI outside diameter, mm,

t_m = SI wall thickness, mm.

The SI plain end linear densities are rounded to the nearest 0.01 kg/m.

M.6 Yield Strength and Tensile Strength

The U.S. Customary values for yield strength and tensile strength were converted to SI values using the following formula:

$$ys_m = 0.00689476 \bullet ys$$

$$ts_m = 0.00689476 \bullet ts$$

where

ys_m = SI yield strength, MPa,

ys = yield strength, psi,

ts_m = SI tensile strength, MPa,

ts = tensile strength, psi.

The converted SI strengths were rounded to the nearest 1 MPa.

M.7 Hydrostatic Test Pressure

The U.S. Customary values for hydrostatic test pressures for all sizes of threaded pipe, all Grade A25 plain-end pipe smaller than size $5^{9/16}$, and all Grade A and Grade B plain-end pipe smaller than size $2^{3/8}$ were converted to SI values using the following formula:

$$P_m = 0.00689476 \cdot P$$

The converted hydrostatic test pressures were rounded to the nearest 100 kPa.

The SI hydrostatic test pressures for plain-end size $5^{9/16}$, Grade A25 and for sizes $2^{3/8}$ and larger Grades A and higher were calculated (not converted) using the following formula:

$$P_m = 2,000 \cdot f \cdot y_{sm} \cdot t_m / D_m$$

where

P_m = SI hydrostatic test pressure, kPa,

P = hydrostatic test pressure, psi,

f = stress factor, see table below,

y_{sm} = SI yield strength, MPa,

t_m = SI wall thickness, mm,

D_m = SI outside diameter, mm.

The calculated hydrostatic test pressure were rounded to the nearest 100 kPa, not to exceed 17 200 kPa for sizes $3^{1/2}$ and smaller or 19 300 kPa for sizes larger than $3^{1/2}$.

The calculated standard hydrostatic test pressures for Grades X42 and higher were rounded to the nearest 100 kPa, not to exceed 20 700 kPa. The calculated alternative hydrostatic test pressure for Grades X42 and higher were rounded to the nearest 100 kPa, not to exceed 50 000 kPa for sizes smaller than 16, or 25 000 kPa for sizes 16 and larger.

Grade	Size	f Factor	
		Standard Test Pressure	Alternative Test Pressure
A25	$5^{9/16}$	0.60	—
A & B	$\geq 2^{3/8}$	0.60	0.75
X42 & higher	$\leq 5^{9/16}$	0.60	0.75
	$> 5^{9/16}$ and $\leq 8^{5/8}$	0.75	0.75
	$> 8^{5/8}$ and < 20	0.85	0.85
	≥ 20	0.90	0.90

M.8 Temperature

The U.S. Customary values for temperatures were converted to SI values using the following formula:

$$^{\circ}\text{C} = \frac{5}{9} (^{\circ}\text{F} - 32)$$

where

$^{\circ}\text{C}$ = SI temperature, degrees Celsius,

$^{\circ}\text{F}$ = temperature, degrees Fahrenheit.

The SI temperatures were rounded to the nearest 1°C .

M.9 Charpy Impact Energy

The U.S. Customary values for impact energy were converted to SI values using the following formula:

$$E_m = 1.35582 \cdot E$$

where

E_m = Energy, J,

E = Energy, ft-lb.

The SI energy values were rounded to the nearest 1 J.

M.10 Minimum Length of Couplings

The U.S. Customary values for the minimum lengths of couplings in inches and fractions were converted to full decimal equivalents in U.S. Customary units without rounding, and then the full decimal equivalents were converted to SI values using the following formula:

$$N_{Lm} = 25.4 \cdot N_L$$

where

N_{Lm} = SI minimum length of couplings, mm,

N_L = the full decimal equivalent, without rounding, of the minimum lengths of couplings, in.

The SI minimum lengths of coupling were rounded to the nearest 0.01 mm.

M.11 Diameter of Coupling Recess

The U.S. Customary values for diameters of the coupling recess's were converted to SI values using the following formula:

$$Q_m = 25.4 \cdot Q$$

where

Q_m = SI diameter of the coupling recess, mm,

Q = diameter of the coupling recess, in.

The SI diameter of the couplings recesses were rounded to the nearest 0.01 mm.

M.12 Width of the Coupling Bearing Face

The U.S. Customary values for widths of the bearing face of couplings were converted to SI values using the following formula:

$$b_m = 25.4 \bullet b$$

where

b_m = SI width of the coupling bearing face, mm,

b = width of the coupling bearing face, in.

The SI width of the coupling bearing face were rounded to the nearest 0.1 mm.

M.13 Coupling Weights

The U.S. Customary values for calculated coupling weights were converted to SI values using the following formula:

$$W_m = 0.4535924 \bullet w$$

where

W_m = SI calculated coupling weight, kg,

w = calculated coupling weight, lb.

The SI calculated coupling weights were rounded to the nearest 0.01 kg.

State Sales Tax – The American Petroleum Institute is required to collect sales tax on publications mailed to the following states: AL, AR, CT, DC, FL, GA, IL, IN, IA, KS, KY, ME, MD, MA, MI, MN, MO, NE, NJ, NY, NC, ND, OH, PA, RI, SC, TN, TX, VT, VA, WV, and WI. Prepayment of orders shipped to these states should include applicable sales tax unless a purchaser is exempt. If exempt, please print your state exemption number and enclose a copy of the current exemption certificate.

Exemption Number: _____ State: _____

Quantity	Order Number	Title	SO*	Unit Price	Total
	G05LC3	Spec 5LC, CRA Line Pipe		\$ 100.00	
	G05LD2	Spec 5LD, CRA Clad or Lined Steel Pipe		\$ 75.00	
	G05L15	RP 5L1, Railroad Transportation of Line Pipe		\$ 50.00	
	G02700	RP 5L2 Internal Coating of Line Pipe for Non-Corrosive Gas Transmission Service		\$ 50.00	
	G05L33	RP 5L3, Conducting Drop-Weight Tear Tests on Line Pipe		\$ 50.00	
	G02906	RP 5L7, Unprimed Internal Fusion Bonded Epoxy Coating of Line Pipe		\$ 55.00	
	G05L82	RP 5L8, Field Inspection of New Line Pipe		\$ 80.00	
	G05LW2	RP 5LW, Transportation of Line Pipe on Barges and Marine Vessels		\$ 50.00	

Shipping and Handling – All orders are shipped via UPS or First Class Mail in the U.S. and Canada. Orders to all other countries will be sent by Airmail. U.S. and Canada, \$5 per order handling fee, plus actual shipping costs. All other countries, for Airmail (standard service) add 25% of order value. All other countries, for UPS Next Day, add an additional 10% of order value.

Rush Shipping Charge – FedEx, \$10 in addition to customer providing FedEx account number: _____. UPS Next Day, \$10 plus the actual shipping costs (1-9 items). UPS Second Day, add \$10 plus the actual shipping costs (1-9 items).

Rush Bulk Orders – 1-9 items, \$10. Over 9 items, add \$1 each for every additional item. **NOTE: Shipping on foreign orders cannot be rushed without FedEx account number.**

Returns Policy - Only publications received in damaged condition or as a result of shipping or processing errors, if unstamped and otherwise not defaced, may be returned for replacement within 45 days of the initiating invoice date. A copy of the initiating invoice must accompany each return. Material which has neither been damaged in shipment nor shipped in error requires prior authorization and may be subject to a shipping and handling charge. **All returns must be shipped prepaid using third class postage. If returns are due to processing or shipping errors, API will refund the third class postage.**
